Functional Description

The TLE 4476 is a monolithic integrated voltage regulator providing two output voltages, Q1 is a 3.3 V output for loads up to 350 mA and Q2 is a 5 V output providing 430 mA. The device is available in the P-TO252-5-1 (D-PAK) package. Output 2 can be switched ON/OFF via the Enable input EN.

The TLE 4476 is designed to supply microprocessor systems under the severe conditions of automotive applications and is therefore equipped with additional protection functions against over load, short circuit and over temperature.

Application Information

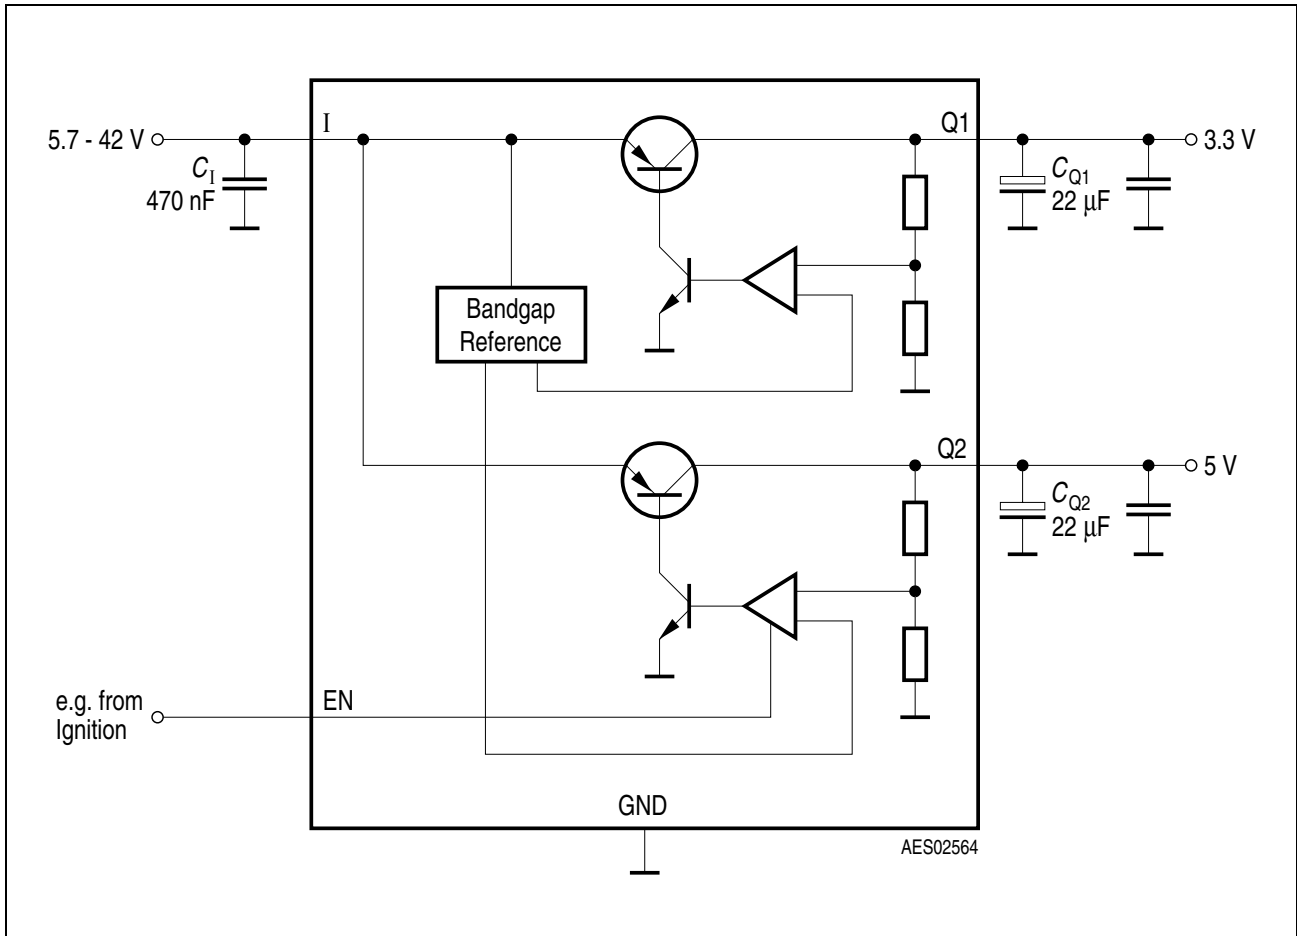

Figure 3 Application Circuit

Input, Output

The input capacitor C_1 is necessary for compensating line influences. Using a resistor of approx. 1Ω in series with C_1 , the LC circuit of input inductivity and input capacitance can be damped. To stabilize the regulation circuits of the stand-by and main regulator, output capacitors C_{Q1} and C_{Q2} are necessary. Stability is guaranteed at values $C_{Q1} \geq 10 \mu\text{F}$ ($\text{ESR} \leq 2 \Omega$) and $C_{Q2} \geq 10 \mu\text{F}$ ($\text{ESR} \leq 3 \Omega$) within the operating temperature range.

Enable

Using the enable feature the output 2 (5 V output) can be switched ON or OFF. The enable input can be connected directly to terminal 30 (battery line) or 15 (ignition line). It is also possible to control the output 2 via the microcontroller.
