

# +5V, Fail-Safe, 20Mbps, Profibus RS-485/ RS-422 Transceivers

MAX3460-MAX3464

## General Description

The MAX3460–MAX3464 are high-speed differential bus transceivers for RS-485 and RS-422 communications. They are designed to meet TIA/EIA-422-B, TIA/EIA-485-A, V.11, and X.27 standards. The transceiver complies with the Profibus specification providing +2.1V output level with a 54Ω load, 20Mbps data rate, and output skew less than 2ns. Each part contains one three-state differential line driver and one differential input line receiver. The devices operate from a +5V supply and feature true fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted. This enables all receiver outputs on a terminated bus to output logic highs when all transmitters are disabled.

All devices feature a 1/4 standard unit load receiver input impedance that allows 128 transceivers on the bus. Driver and receiver propagation delays are guaranteed under 20ns for multidrop, clock distribution applications. Drivers are short-circuit current limited and are protected against excessive power dissipation by thermal shutdown circuitry. The driver and receiver feature active-high and active-low enables, respectively, that can be connected together externally to serve as a direction control.

## Applications

High-Speed RS-485 Communications  
High-Speed RS-422 Communications  
Level Translators  
Industrial-Control Local Area Networks  
Profibus Applications

## Features

- ◆ Recommended for Profibus Applications
- ◆ Guaranteed 20Mbps Data Rate
- ◆ 20ns Transmitter and Receiver Propagation Delay
- ◆ 2ns Transmitter and Receiver Skew
- ◆ High Differential Driver Output Level (2.1V on 54Ω)
- ◆ Hot-Swap Versions
- ◆ 1μA Shutdown Supply Current
- ◆ Low Supply Current Requirements (2.5mA typ)
- ◆ Allow Up to 128 Transceivers on the Bus
- ◆ True Fail-Safe Receiver while Maintaining EIA/TIA-485 Compatibility
- ◆ Designed for Multipoint Transmissions on Long or Noisy Bus Lines
- ◆ Full Duplex and Half Duplex Versions Available
- ◆ Phase Controls to Correct for Twisted-Pair Reversal for 14-Pin Versions
- ◆ Current-Limiting and Thermal Shutdown for Driver Overload Protection

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 1:** All currents into the device are positive; all currents out of the device are negative. All voltages are referenced to device ground, unless otherwise noted.

**Note 2:**  $\Delta V_{OD}$  and  $\Delta V_{OC}$  are the changes in  $V_{OD}$  and  $V_{OC}$ , respectively, when the DI input changes state.

**Note 3:** The short-circuit output current applies to peak current just prior to foldback-current limiting; the short-circuit foldback output current applies during current limiting to allow a recovery from bus contention.

**Note 4:** Capacitive load includes test probe and fixture capacitance.

**Note 5:** Shutdown is enabled by bringing  $\overline{RE}$  high and DE low or by bringing SHDN high. If the enable inputs are in this state for less than 50ns, the device is guaranteed not to enter shutdown. If the enable inputs are in this state for at least 800ns, the device is guaranteed to have entered shutdown.

## Detailed Description

The MAX3460-MAX3464 high-speed transceivers for RS-485/RS-422 communication contain one driver and one receiver. These devices feature true fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted, or when they are connected to a terminated transmission line with all drivers disabled (see the *True Fail-Safe* section). The MAX3460-MAX3464's driver slew rates allow transmit speeds up to 20Mbps.

The MAX3463 and MAX3464 are half-duplex transceivers, while the MAX3460, MAX3461, and MAX3462 are full-duplex transceivers. All of these parts operate from a single +5V supply. Drivers are output short-circuit current limited. Thermal shutdown circuitry protects drivers against excessive power dissipation. When activated, the thermal shutdown circuitry places the driver outputs into a high-impedance state. The MAX3460 and MAX3463 devices have a hot-swap input structure that prevents disturbances on the differential signal lines when a circuit board is plugged into a "hot" backplane (see *Hot Swap* section). All devices have output levels that are compatible with Profibus standards.

### True Fail-Safe

The MAX3460-MAX3464 guarantee a logic-high receiver output when the receiver inputs are shorted or open, or when they are connected to a terminated transmission line with all drivers disabled. This is done by setting the receiver threshold between -50mV and -200mV. If the differential receiver input voltage (A - B) is greater than or equal to -50mV, RO is logic high. If A - B is less than or equal to -200mV, RO is logic low. In the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to 0V by the termination. With the receiver thresholds of the MAX3460-MAX3464, this results in a logic high with a 50mV minimum noise margin. Unlike previous true fail-safe devices, the -50mV to -200mV threshold complies with the  $\pm 200\text{mV}$  EIA/TIA-485 standard.

### Hot-Swap Capability

#### Hot-Swap Inputs

When circuit boards are inserted into a "hot" or powered backplane, disturbances to the enable and differential receiver inputs can lead to data errors. Upon initial circuit board insertion, the processor undergoes its power-up sequence. During this period, the output drivers are high impedance and are unable to drive the DE input of the MAX3460/MAX3463 to a defined logic

level. Leakage currents up to  $10\mu\text{A}$  from the high-impedance output could cause DE to drift to an incorrect logic state. Additionally, parasitic circuit board capacitance could cause coupling of  $V_{CC}$  or GND to DE. These factors could improperly enable the driver.

When  $V_{CC}$  rises, an internal pulldown circuit holds DE low for around  $15\mu\text{s}$ . After the initial power-up sequence, the pulldown circuit becomes transparent, resetting the hot-swap tolerable input.

### Hot-Swap Input Circuitry

The MAX3460/MAX3463 enable inputs feature hot-swap capability. At the input there are two NMOS devices, M1 and M2 (Figure 4). When  $V_{CC}$  ramps from 0, an internal  $15\mu\text{s}$  timer turns on M2 and sets the SR latch, which also turns on M1. Transistors M2, a 2mA current sink, and M1, a  $100\mu\text{A}$  current sink, pull DE to GND through a  $5.6\text{k}\Omega$  resistor. M2 is designed to pull DE to the disabled state against an external parasitic capacitance up to  $100\text{pF}$  that can drive DE high. After  $15\mu\text{s}$ , the timer deactivates M2 while M1 remains on, holding DE low against three-state leakages that can drive DE high. M1 remains on until an external source overcomes the required input current. At this time, the SR latch resets and M1 turns off. When M1 turns off, DE reverts to a standard, high-impedance CMOS input. Whenever  $V_{CC}$  drops below 1V, the hot-swap input is reset.

For RE there is a complimentary circuit employing two PMOS devices pulling RE to  $V_{CC}$ .

## Applications Information

### 128 Transceivers on the Bus

The standard RS-485 receiver input impedance is  $12k\Omega$  (one-unit load), and the standard driver can drive up to 32 unit loads. The MAX3460-MAX3464 family of transceivers has a 1/4-unit-load receiver input impedance ( $48k\Omega$ ), allowing up to 128 transceivers to be connected in parallel on one communication line. Any combination of these devices and/or other RS-485 transceivers with a total of 32 unit loads or less can be connected to the line.

### Low-Power Shutdown Mode (except MAX3462)

Low-power shutdown mode is initiated by bringing SHDN high (MAX3460/MAX3461), or both  $\overline{RE}$  high and DE low. In shutdown, the devices typically draw only  $1\mu A$  of supply current.  $\overline{RE}$  and DE can be driven simultaneously; the parts are guaranteed not to enter shutdown if  $\overline{RE}$  is high and DE is low for less than 50ns. If the inputs are in this state for at least 800ns, the parts are guaranteed to enter shutdown.

### Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus contention. The first, a foldback current limit on the output stage, provides immediate protection against short circuits over the whole common-mode voltage range (see *Typical Operating Characteristics*). The second, a thermal shutdown circuit, forces the driver outputs into a

high-impedance state if the die temperature exceeds  $+140^\circ C$ .

### Propagation Delay

Many digital encoding schemes depend on the difference between the driver and receiver propagation delay times. Typical propagation delays are shown in the *Typical Operating Characteristics*. The difference in receiver delay times,  $t_{PLH} - t_{PHL}$ , is a maximum of 2ns. The driver skew time  $t_{PLH} - t_{PHL}$  is also a maximum of 2ns.

### Typical Applications

The MAX3460-MAX3464 transceivers are designed for bidirectional data communications on multipoint bus transmission lines. Figures 13 and 14 show typical network applications circuits. To minimize reflections, the line should be terminated at both ends in its characteristic impedance, and stub lengths off the main line should be kept as short as possible.

### Profibus Termination

The MAX3460-MAX3464 are designed for driving Profibus termination networks. With a worst-case loading of two termination networks with  $220\Omega$  termination impedance and  $390\Omega$  pullups and pulldowns, the drivers can drive  $V_{A-B} > 2.1V$  output.
