

4,194,304 WORD x 1 BIT DYNAMIC RAM * This is advanced information and specifications are subject to change without notice.

DESCRIPTION

The TC514100J/Z is the new generation dynamic RAM organized 4,194,304 words by 1 bit. The TC514100J/Z utilizes TOSHIBA's CMOS Silicon gate process technology as well as advanced circuit techniques to provide wide operating margins, both internally and to the system user. Multiplexed address inputs permit the TC514100J/Z to be packaged in a standard 26/20 pin plastic SOJ and 20 pin plastic ZIP. The package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment. System oriented features include single power supply of 5V±10% tolerance, direct interfacing capability with high performance logic families such as Schottky TTL.

FEATURES

- 4,194,304 word by 1 bit organization
- Fast access time and cycle time
- Low Power
 - 550mW Operating (TC514100J/Z-80)
 - 468mW Operating (TC514100J/Z-10)
 - 5.5mW MAX. Standby
- Output unlatched at cycle end allows two-dimensional chip selection
- Common I/O capability using "EARLY WRITE" operation
- Read-Modify-Write, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh, $\overline{\text{RAS}}$ -only refresh, Hidden refresh, Fast Page Mode and Test Mode capability
- All inputs and output TTL compatible
- 1024 refresh cycles/16ms
- Package Plastic SOJ: TC514100J
Plastic ZIP: TC514100Z

		TC514100J/Z-80/-10	
t _{RAC}	RAS Access Time	80ns	100ns
t _{AA}	Column Address Access Time	40ns	50ns
t _{CAC}	CAS Access Time	20ns	25ns
t _{RC}	Cycle Time	150ns	180ns
t _{PC}	Fast Page Mode Cycle Time	50ns	60ns

- Single power supply of 5V±10% with a built-in V_{BB} generator

C_O	Output Capacitance (D_{OUT})	-	7	pF

TC514100J/Z-80

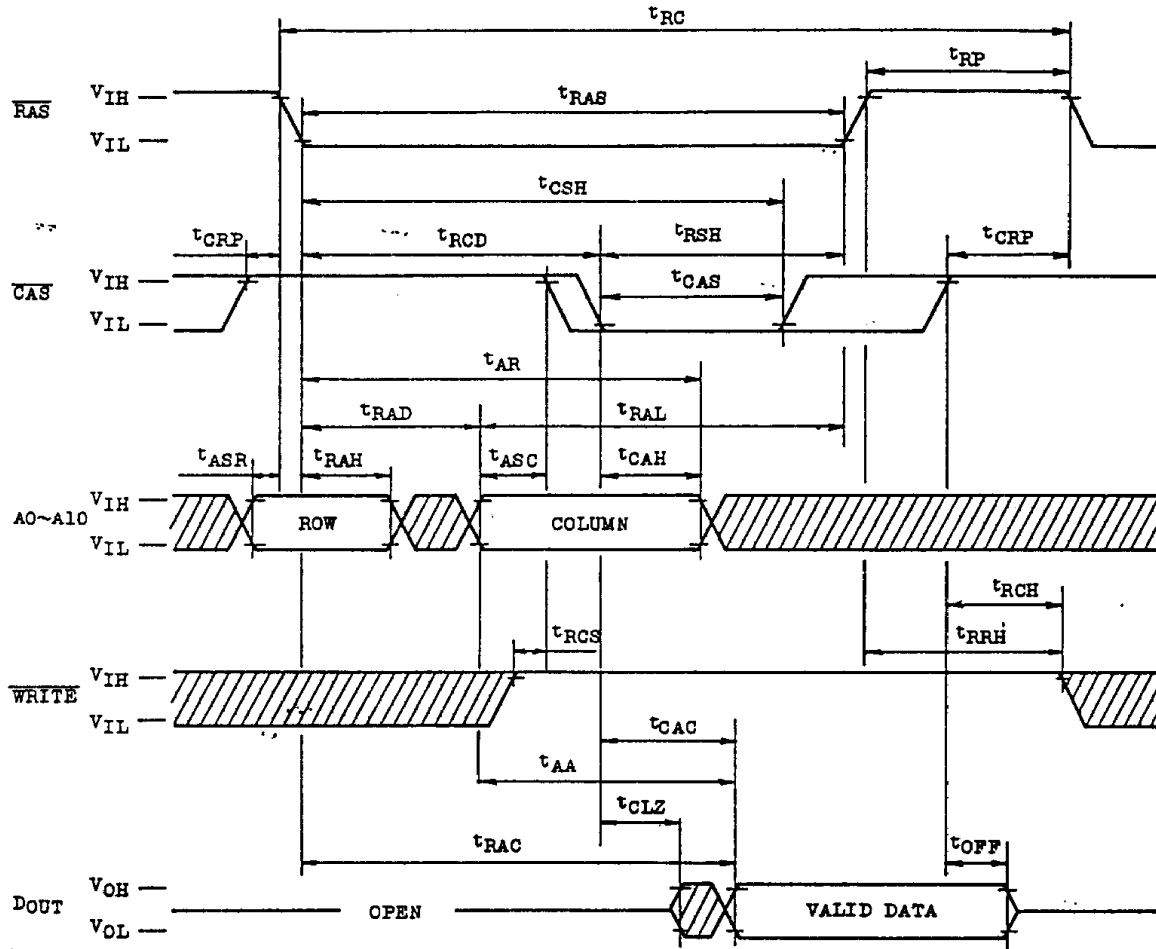

TC514100J/Z-10

NOTES:

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.
2. All voltages are referenced to V_{SS} .
3. I_{CC1} , I_{CC3} , I_{CC4} , I_{CC6} depend on cycle rate.
4. I_{CC1} , I_{CC4} depend on output loading. Specified values are obtained with the output open.
5. Column address can be changed once or less while $\overline{RAS}=V_{IL}$ and $\overline{CAS}=V_{IH}$.
6. An initial pause of 200 μ s is required after power-up followed by 8 \overline{RAS} only refresh cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 \overline{CAS} before \overline{RAS} refresh cycles instead of 8 \overline{RAS} only refresh cycles are required.
7. AC measurements assume $t_T=5$ ns.
8. $V_{IH}(\text{min.})$ and $V_{IL}(\text{max.})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
9. Measured with a load equivalent to 2 TTL loads and 100pF.
10. $t_{OFF}(\text{max.})$ defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
11. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
12. These parameters are referenced to \overline{CAS} leading edge in early write cycles and to \overline{WRITE} leading edge in read-modify-write cycles.
13. t_{WCS} , t_{RWD} , t_{CWD} , t_{AWD} and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet at electrical characteristics only. If $t_{WCS} \geq t_{WCS}(\text{min.})$, the cycle is an early write cycle and data out pin will remain open circuit (high impedance) through the entire cycle; If $t_{RWD} \geq t_{RWD}(\text{min.})$, $t_{CWD} \geq t_{CWD}(\text{min.})$, $t_{AWD} \geq t_{AWD}(\text{min.})$ and $t_{CPWD} \geq t_{CPWD}(\text{min.})$ (Fast Page Mode), the cycle is a read-modify-write cycle and the data out will contain data read from the selected cell: If neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
14. Operation within the $t_{RCD}(\text{max.})$ limit insures that $t_{RAC}(\text{max.})$ can be met. $t_{RCD}(\text{max.})$ is specified as a reference point only: If t_{RCD} is greater than the specified $t_{RCD}(\text{max.})$ limit, then access time is controlled by t_{CAC} .
15. Operation within the $t_{RAD}(\text{max.})$ limit insures that $t_{RAC}(\text{max.})$ can be met. $t_{RAD}(\text{max.})$ is specified as a reference point only: If t_{RAD} is greater than the specified $t_{RAD}(\text{max.})$ limit, then access time is controlled by t_{AA} .

TEST MODE

The TC514100J/Z is the RAM organized 4,194,304 words by 1 bit, it is internally organized 524,288 words by 8 bits. In "Test Mode", data are written into 8 sectors in parallel and retrieved the same way. A_{10R}, A_{10C} and A_{0C} are not used. If, upon reading, all bits are equal (all "1"s or "0"s), the data output pin indicates a "1". If any of the bits differed, the data output pin would indicate a "0". Fig. 1 shows the block diagram of TC514100J/Z. In "Test Mode", the 4M DRAM can be tested as if it were a 512K DRAM.

" $\overline{\text{WRITE}}$, $\overline{\text{CAS}}$ Before $\overline{\text{RAS}}$ Refresh Cycle" puts the device into "Test Mode". And " $\overline{\text{CAS}}$ Before $\overline{\text{RAS}}$ Refresh Cycle" or " $\overline{\text{RAS}}$ Only Refresh Cycle" puts it back into "Normal Mode". In the Test Mode, " $\overline{\text{WRITE}}$, $\overline{\text{CAS}}$ Before $\overline{\text{RAS}}$ Refresh Cycle" performs the refresh operation with the internal refresh address counter. The "Test Mode" function reduces test times (1/8 in case of N test pattern)..
