

Agilent ATF-54143 Low Noise Enhancement Mode Pseudomorphic HEMT in a Surface Mount Plastic Package

Data Sheet

Description

Agilent Technologies's ATF-54143 is a high dynamic range, low noise, E-PHEMT housed in a 4-lead SC-70 (SOT-343) surface mount plastic package.

The combination of high gain, high linearity and low noise makes the ATF-54143 ideal for cellular/PCS base stations, MMDS, and other systems in the 450 MHz to 6 GHz frequency range.

Surface Mount Package SOT-343

Pin Connections and Package Marking

Note:

Top View. Package marking provides orientation and identification

"4F" = Device Code

"x" = Date code character identifies month of manufacture.

Features

- High linearity performance
- Enhancement Mode Technology^[1]
- Low noise figure
- Excellent uniformity in product specifications
- 800 micron gate width
- Low cost surface mount small plastic package SOT-343 (4 lead SC-70)
- Tape-and-Reel packaging option available

Specifications

2 GHz; 3 V, 60 mA (Typ.)

- 36.2 dBm output 3rd order intercept
- 20.4 dBm output power at 1 dB gain compression
- 0.5 dB noise figure
- 16.6 dB associated gain

Applications

- Low noise amplifier for cellular/PCS base stations
- LNA for WLAN, WLL/RLL and MMDS applications
- General purpose discrete E-PHEMT for other ultra low noise applications

Note:

1. Enhancement mode technology requires positive V_{gs}, thereby eliminating the need for the negative gate voltage associated with conventional depletion mode devices.

Agilent Technologies

Innovating the HP Way

ATF-54143 Absolute Maximum Ratings^[1]

Symbol	Parameter	Units	Absolute Maximum
V_{DS}	Drain - Source Voltage ^[2]	V	5
V_{GS}	Gate - Source Voltage ^[2]	V	-5 to 1
V_{GD}	Gate Drain Voltage ^[2]	V	5
I_{DS}	Drain Current ^[2]	mA	120
P_{diss}	Total Power Dissipation ^[3]	mW	360
$P_{in\ max.}$	RF Input Power	dBm	10
T_{CH}	Channel Temperature	°C	150
T_{STG}	Storage Temperature	°C	-65 to 150
θ_{JC}	Thermal Resistance ^[4]	°C/W	162

- Notes:**
- 1. Operation of this device in excess of any one of these parameters may cause permanent damage.
 - 2. Assumes DC quiescent conditions.
 - 3. Source lead temperature is 25°C. Derate 6 mW/°C for $T_L > 40^\circ\text{C}$.
 - 4. Thermal resistance measured using 150°C Liquid Crystal Measurement method.

Figure 25. MSG/MAG and $|S_{21}|^2$ vs. Frequency at 3V, 40 mA.

Notes:

- F_{min} values at 2 GHz and higher are based on measurements while the F_{min} s below 2 GHz have been extrapolated. The F_{min} values are based on a set of 16 noise figure measurements made at 16 different impedances using an ATN NP5 test system. From these measurements a true F_{min} is calculated. Refer to the noise parameter application section for more information.
- S and noise parameters are measured on a microstrip line made on 0.025 inch thick alumina carrier. The input reference plane is at the end of the gate lead. The output reference plane is at the end of the drain lead. The parameters include the effect of four plated through via holes connecting source landing pads on top of the test carrier to the microstrip ground plane on the bottom side of the carrier. Two 0.020 inch diameter via holes are placed within 0.010 inch from each source lead contact point, one via on each side of that point.

ATF-54143 Applications Information

Introduction

Agilent Technologies's ATF-54143 is a low noise enhancement mode PHEMT designed for use in low cost commercial applications in the VHF through 6 GHz frequency range. As opposed to a typical depletion mode PHEMT where the gate must be made negative with respect to the source for proper operation, an enhancement mode PHEMT requires that the gate be made more positive than the source for normal operation. Therefore a negative power supply voltage is not required for an enhancement mode device. Biasing an enhancement mode PHEMT is much like biasing the typical bipolar junction transistor. Instead of a 0.7V base to emitter voltage, the ATF-54143 enhancement mode PHEMT requires about a 0.6V potential between the gate and source for a nominal drain current of 60 mA.

Matching Networks

The techniques for impedance matching an enhancement mode device are very similar to those for matching a depletion mode device. The only difference is in the method of supplying gate bias. S and Noise Parameters for various bias conditions are listed in this data sheet. The circuit shown in Figure 1 shows a typical LNA circuit normally used for 900 and 1900 MHz applications. High pass impedance matching networks consisting of L1/C1 and L4/C4 provide the appropriate match for noise figure, gain, S11 and S22. The high pass structure also provides low frequency gain reduction which can be beneficial from the standpoint of improving out-of-band rejection at lower frequencies.

Figure 1. Typical ATF-54143 LNA with Passive Biasing.

Capacitors C2 and C5 provide a low impedance in-band RF bypass for the matching networks. Resistors R3 and R4 provide a very important low frequency termination for the device. The resistive termination improves low frequency stability. Capacitors C3 and C6 provide the low frequency RF bypass for resistors R3 and R4. Their value should be chosen carefully as C3 and C6 also provide a termination for low frequency mixing products. These mixing products are as a result of two or more in-band signals mixing and producing third order in-band distortion products. The low frequency or difference mixing products are bypassed by C3 and C6. For best suppression of third order distortion products based on the CDMA 1.25 MHz signal spacing, C3 and C6 should be 0.1 μ F in value. Smaller values of capacitance will not suppress the generation of the 1.25 MHz difference signal and as a result will show up as poorer two tone IP3 results.

Bias Networks

One of the major advantages of the enhancement mode technology is that it allows the designer to be able to dc ground the source leads and then merely apply a positive voltage on the gate to set the desired amount of quiescent drain current I_d .

Whereas a depletion mode PHEMT pulls maximum drain current when $V_{gs} = 0V$, an enhancement mode PHEMT pulls only a small amount of leakage current when $V_{gs} = 0V$. Only when V_{gs} is increased above V_{to} , the device threshold voltage, will drain current start to flow. At a V_{ds} of 3V and a nominal V_{gs} of 0.6V, the drain current I_d will be approximately 60 mA. The data sheet suggests a minimum and maximum V_{gs} over which the desired amount of drain current will be achieved. It is also important to note that if the gate terminal is left open circuited, the device will pull some amount of drain current due to leakage current creating a voltage differential between the gate and source terminals.

Passive Biasing

Passive biasing is the simplest form of biasing the ATF-54143. The voltage divider consisting of resistors R1 and R2 sets the desired V_{gs} . Resistor R3 in addition to being the low frequency resistive termination also provides some voltage feedback for the device. The amount of current allowed to flow in R1 and R2 depends on the amount of gate leakage current the device pulls. Normal leakage current is usually only a few microamps. As the device is driven closer to P1dB, the leakage current will increase. The bias supply should maintain a constant gate voltage under all drive conditions.

Resistor R3 is calculated based on desired V_{ds} , I_{ds} and available power supply voltage.

$$R3 = \frac{V_{DD} - V_{ds}}{I_{ds} + I_{BB}} \quad (1)$$

V_{DD} is the power supply voltage.
 V_{ds} is the device drain to source voltage.

I_{ds} is the desired drain current.
 I_{BB} is the current flowing through the R1/R2 resistor voltage divider network.

The value of resistors R1 and R2 are calculated with the following formulas

$$R1 = \frac{V_{gs}}{I_{BB}} \quad (2)$$

$$R2 = \frac{(V_{ds} - V_{gs}) R1}{V_{gs}} \quad (3)$$

Example Circuit

$$\begin{aligned} V_{DD} &= 5V \\ V_{ds} &= 3V \\ I_{ds} &= 60mA \\ V_{gs} &= 0.59V \end{aligned}$$

Choose I_{BB} to be at least 10X the maximum expected gate leakage current. I_{BB} was chosen to be 2 mA for this example. Using equations (1), (2), and (3) the resistors are calculated as follows

$$\begin{aligned} R1 &= 295\Omega \\ R2 &= 1205\Omega \\ R3 &= 32.3\Omega \end{aligned}$$

Active Biasing

Active biasing provides a means of keeping the quiescent bias point constant over temperature and constant over lot to lot variations in device dc performance. The advantage of the active biasing of an enhancement mode PHEMT versus a depletion mode PHEMT is that a negative power source is not required. The techniques of active biasing an enhancement mode device are very similar to those used to bias a bipolar junction transistor.

Figure 2. Typical ATF-54143 LNA with Active Biasing.

An active bias scheme is shown in Figure 2. R1 and R2 provide a constant voltage source at the base of a PNP transistor at Q2. The constant voltage at the base of Q2 is raised by 0.7 volts at the emitter. The constant emitter voltage plus the regulated V_{DD} supply are present across resistor R3. Constant voltage across R3 provides a constant current supply for the drain current. Resistors R1 and R2 are used to set the desired V_{ds} . The combined series value of these resistors also sets the amount of extra current consumed by the bias network. The equations that describe the circuit's operation are as follows.

$$V_E = V_{ds} + (I_{ds} \cdot R4) \quad (1)$$

$$R3 = \frac{V_{DD} - V_E}{I_{ds}} \quad (2)$$

$$V_B = V_E - V_{BE} \quad (3)$$

$$V_B = \frac{R1}{R1 + R2} V_{DD} \quad (4)$$

$$V_{DD} = I_{BB} (R1 + R2) \quad (5)$$

Rearranging equation (4) provides the following formula

$$R2 = \frac{R1 (V_{DD} - V_B)}{V_B} \quad (4A)$$

and rearranging equation (5) provides the following formula

$$R1 = \frac{V_{DD}}{I_{BB} \left(1 + \frac{V_{DD} - V_B}{V_B} \right)} \quad (5A)$$

Example Circuit

$$\begin{aligned} V_{DD} &= 5V \\ V_{ds} &= 3V \\ I_{ds} &= 60mA \\ R4 &= 10\Omega \\ V_{BE} &= 0.7V \end{aligned}$$

Equation (1) calculates the required voltage at the emitter of the PNP transistor based on desired V_{ds} and I_{ds} through resistor R4 to be 3.6V. Equation (2) calculates the value of resistor R3 which determines the drain current I_{ds} . In the example $R3=23.3\Omega$. Equation (3) calculates the voltage required at the junction of resistors R1 and R2. This voltage plus the step-up of the base emitter junction determines the regulated V_{ds} . Equations (4) and (5) are solved simultaneously to determine the value of resistors R1 and R2. In the example $R1=1450\Omega$ and $R2=1050\Omega$. Resistors R6 and R7 are 1 k Ω each and are normally not critical for low noise operation. As the device is driven closer to P1dB, the impedance represented by R6 and R7 may have to be decreased in order to maintain a more constant bias point. R7 is used as a “keep-alive” resistor for the PNP transistor. Without R7, the collector current flowing through the PNP transistor is hardly enough to turn the transistor on.

ATF-54143 curtice ADS Model

Designing with S and Noise Parameters and the Non-Linear Model

The non-linear model describing the ATF-54143 includes both the die and associated package model. The package model includes the effect of the pins but does not include the effect of the additional ground-plane associated with grounding the source leads through the printed circuit board. The device S and Noise Parameters do include the effect of 0.020 inch thickness printed circuit board vias. When comparing simulation results between the measured S parameters and the

simulated non-linear model, be sure to include the effect of the printed circuit board to get an accurate comparison. This is shown schematically in Figure 3.

For Further Information

The information presented here is an introduction to the use of the ATF-54143 enhancement mode PHEMT. More detailed application circuit information is available from Agilent Technologies. Consult the web page or your local Agilent Technologies sales representative.

Figure 3. Adding Vias to the ATF-54143 Non-Linear Model for Comparison to Measured S and Noise Parameters.

Noise Parameter Applications Information

F_{min} values at 2 GHz and higher are based on measurements while the F_{min} s below 2 GHz have been extrapolated. The F_{min} values are based on a set of 16 noise figure measurements made at 16 different impedances using an ATN NP5 test system. From these measurements, a true F_{min} is calculated. F_{min} represents the true minimum noise figure of the device when the device is presented with an impedance matching network that transforms the source impedance, typically 50Ω, to an impedance represented by the reflection coefficient Γ_o . The designer must design a matching network that will present Γ_o to the device with minimal associated circuit losses. The noise figure of the completed amplifier is equal to the noise figure of the device plus the losses of the matching network preceding the device. The noise figure of the device is equal to F_{min} only when the device is presented with Γ_o . If the reflection coefficient of the matching network is other

than Γ_o , then the noise figure of the device will be greater than F_{min} based on the following equation.

$$NF = F_{min} + \frac{4 R_n}{Z_o} \frac{|\Gamma_s - \Gamma_o|^2}{(1 + |\Gamma_o|^2)(1 - |\Gamma_s|^2)}$$

Where R_n/Z_o is the normalized noise resistance, Γ_o is the optimum reflection coefficient required to produce F_{min} and Γ_s is the reflection coefficient of the source impedance actually presented to the device. The losses of the matching networks are non-zero and they will also add to the noise figure of the device creating a higher amplifier noise figure. The losses of the matching networks are related to the Q of the components and associated printed circuit board loss. Γ_o is typically fairly low at higher frequencies and increases as frequency is lowered. Larger gate width devices will typically have a lower Γ_o as compared to narrower gate width devices. Typically for FETs, the higher Γ_o usually infers that an impedance

much higher than 50Ω is required for the device to produce F_{min} . At VHF frequencies and even lower L Band frequencies, the required impedance can be in the vicinity of several thousand ohms. Matching to such a high impedance requires very hi-Q components in order to minimize circuit losses. As an example at 900 MHz, when airwound coils ($Q > 100$) are used for matching networks, the loss can still be up to 0.25 dB which will add directly to the noise figure of the device. Using multilayer molded inductors with Qs in the 30 to 50 range results in additional loss over the airwound coil. Losses as high as 0.5 dB or greater add to the typical 0.15 dB F_{min} of the device creating an amplifier noise figure of nearly 0.65 dB. A discussion concerning calculated and measured circuit losses and their effect on amplifier noise figure is covered in Agilent Application 1085.

Ordering Information

Part Number	No. of Devices	Container
ATF-54143-TR1	3000	7" Reel
ATF-54143-TR2	10000	13" Reel
ATF-54143-BLK	100	antistatic bag

当社半導体部品のご使用にあたって

仕様及び仕様書に関して

- ・ 本仕様は製品改善および技術改良等により予告なく変更する場合があります。ご使用の際には最新の仕様を問い合わせの上、用途のご確認をお願いいたします。
- ・ 本仕様記載内容を無断で転載または複写することは禁じられております。
- ・ 本仕様内でご紹介している応用例（アプリケーション）は当社製品がご使用できる代表的なものです。ご使用において第三者の知的財産権などの保証または実施権の許諾に対して問題が発生した場合、当社はその責任を負いかねます。
- ・ 仕様書はメーカーとユーザ間で交わされる製品に関する使用条件や誤使用防止事項を言及するものです。仕様書の条件外で保存、使用された場合に動作不良、機械不良が発生しても当社は責任を負いかねます。ただし、当社は納品後1年以内に当社の責任に帰すべき理由で、不良或いは故障が発生した場合、無償で製品を交換いたします。
- ・ 仕様書の製品が製造上および政策上の理由で満足できない場合には変更の権利を当社が有し、その交渉は当社の要求によりすみやかに行われることとさせていただきます。なお、基本的に変更は3ヶ月前、廃止は1年前にご連絡致しますが、例外もございますので予めご了承ください。

ご使用用途に関して

- ・ 当社の製品は、一般的な電子機器（コンピュータ、OA 機器、通信機器、AV 機器、家電製品、アミューズメント機器、計測機器、一般産業機器など）の一部に組み込まれて使用されるものです。極めて高い信頼性と安全性が要求される用途（輸送機器、航空・宇宙機器、海底中継器、原子力制御システム、生命維持のための医療機器などの財産・環境もしくは生命に悪影響を及ぼす可能性を持つ用途）を意図し、設計も製造もされているものではありません。それゆえ、本製品の安全性、品質および性能に関しては、仕様書（又は、カタログ）に記載してあること以外は明示的にも黙示的にも一切の保証をするものではありません。

回路設計上のお願い

- ・ 当社は品質、信頼性の向上に努力しておりますが、一般的に半導体製品の誤動作や、故障の発生は避けられません。本製品の使用に附随し、或いはこれに関連する誤動作、故障、寿命により、他人の生命又は財産に被害や悪影響を及ぼし、或いは本製品を取り付けまたは使用した設備、施設または機械器具に故障が生じ一般公衆に被害を起こしても、当社はその内容、程度を問わず、一切の責任を負いかねます。
お客様の責任において、装置の安全設計をお願いいたします。
