

FEATURES

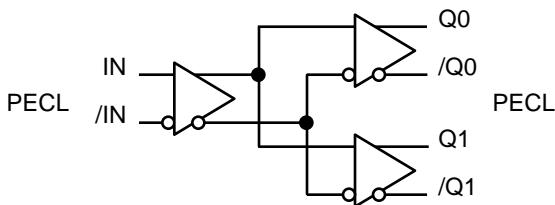

- 2.5V, 3.3V and 5V power supply
- Guaranteed AC parameters over temperature:
 - $f_{MAX} > 3.0\text{GHz}$
 - < 20ps output-to-output skew
 - < 200ps t_r / t_f
 - < 300ps propagation delay
- 100K compatible I/O
- Wide temperature range: -40°C to $+85^\circ\text{C}$
- Available in ultra-small 8-pin MLF™ (2mm x 2mm) package

Precision Edge[®]**DESCRIPTION**

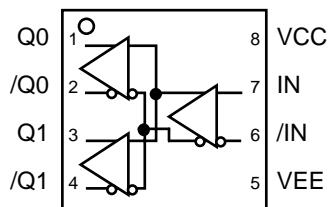

The SY89311U is a precision, high-speed 1:2 differential fanout buffer. Having within-device skews and output transition times significantly improved over the EL11V, the SY89311U is ideally suited for those applications which require the ultimate in AC performance in a small package.

The differential inputs of the SY89311U employ clamping circuitry to maintain stability under open input conditions. If the inputs are left open, the Q outputs will be LOW.

The differential inputs can accept 10/100K ECL/PECL signals (external termination required) and the outputs are 100K ECL/PECL compatible.

PIN DESCRIPTION

Pin Number	Pin Name	Type	Pin Function
1, 2, 3, 4	Q0, /Q0, Q1, /Q1	100K Output	Differential PECL/ECL Outputs: Default to LOW if IN inputs are left open. See "Output Interface Applications" section for recommendations on terminations. Unused output pairs may be left floating without any impact on skew or jitter.
5	VEE, Exposed Pad	Negative Power Supply	Negative Power Supply: V_{EE} and exposed pad must be tied to most negative supply. For PECL/LVPECL connect to ground.
6	/IN	100K Input	Differential PECL/ECL Input: Internal $75\text{k}\Omega$ pull-up and pull-down resistors. If left floating, pin defaults to $V_{CC}/2$. When not used, this input can be left open. See "Input Interface Applications" section for single-ended inputs.
7	IN	100K Input	Differential PECL/ECL Input: Internal $75\text{k}\Omega$ pull-down resistor. If left open, pin defaults LOW. Q output will be LOW. Accepts differential 10K and 100K ECL/PECL. See "Input Interface Applications" section for single-ended inputs.
8	VCC	Positive Power Supply	Positive Power Supply: Bypass with $0.1\mu\text{F}/0.01\mu\text{F}$ low ESR capacitors.

Notes:

1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATING conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package Thermal Resistance values assume exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB.
4. This circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
5. V_{IHCMR} (min) varies 1:1 with V_{EE} , (max) varies 1:1 with V_{CC} .

Notes:

6. Measured with 750mV input signal, 50% duty cycle. V_{DIFF_OUT} is $\geq 400mV$.
7. Skew is measured between outputs under identical transitions. Duty cycle skew is defined only for differential operation when the delays are measured from the cross point of the inputs to the cross point of the outputs.
