

FDC633N N-Channel Enhancement Mode Field Effect Transistor

General Description

This N-Channel enhancement mode power field effect transistors is produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is tailored to minimize on-state resistance. These devices are particularly suited for low voltage applications in notebook computers, portable phones, PCMCIA cards, and other battery powered circuits where fast switching, low in-line power loss and resistance to transients are needed in a very small outline surface mount package.

Features

- 5.2 A, 30 V. $R_{DS(ON)} = 0.042 \Omega @ V_{GS} = 4.5 \text{ V}$
 $R_{DS(ON)} = 0.054 \Omega @ V_{GS} = 2.5 \text{ V}$.
- SuperSOT™-6 package design using copper lead frame for superior thermal and electrical capabilities.
- High density cell design for extremely low $R_{DS(ON)}$.
- Exceptional on-resistance and maximum DC current capability.

Absolute Maximum Ratings $T_A = 25^\circ\text{C}$ unless otherwise noted
