

**FUJITSU****POWER SUPPLY  
MONITOR****MB 3771**September 1986  
Edition 1.0**POWER SUPPLY MONITOR**

The Fujitsu MB 3771 is designed to monitor the voltage level of one or two power supplies (+5V and an arbitrary voltage) in a microprocessor circuit, memory board in large-size computer, for example.

If the circuit's power supply deviates more than a specified amount, then the MB 3771 generates a reset signal to the microprocessor. Thus, the computer data is protected from accidental erasure.

Using the MB 3771 requires few external components. To monitor only a +5V supply, the MB 3771 requires the connection of one external capacitor. The level of an arbitrary detection voltage is determined by two external resistors.

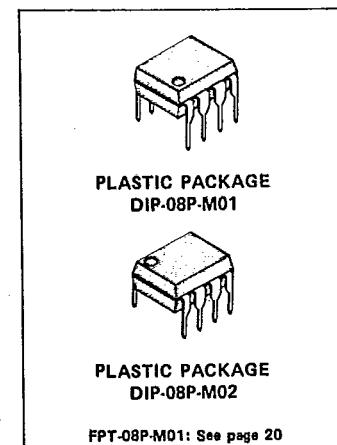

The MB 3771 is available in an 8-pin Dual In-Line, Signal In-Line Package or space saving Flat Package.

- Precision voltage detection ( $V_{SA} = 4.1$  to  $4.3$  V)
- User selectable threshold level with hysteresis ( $V_{SB} \geq 1.24$  V)
- Monitors the voltage of one or two power supplies (5 V and an arbitrary voltage,  $\geq 1.23$  V)
- Low voltage output for reset signal ( $V_{CC} = 0.8$  V typ.)
- Minimal number of external components (one capacitor min.)
- Low power dissipation ( $I_{CC} = 0.35$  mA typ.,  $V_{CC} = 5$  V)
- Available in a variety of packages
  - 8-pin Dual In-Line Package
  - 8-pin Single In-Line Package
  - 8-pin Flat Package

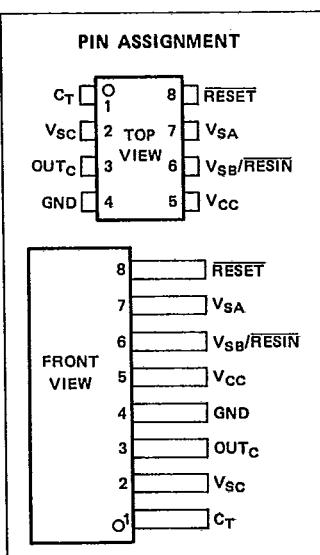

**ABSOLUTE MAXIMUM RATINGS**

| Rating              | Symbol    | Value                               | Unit |
|---------------------|-----------|-------------------------------------|------|
| Supply Voltage      | $V_{CC}$  | -0.3 to +20                         | V    |
| Input Voltage A     | $V_{SA}$  | -0.3 to $V_{CC}+0.3$<br>( $<+20$ )  | V    |
| Input Voltage B     | $V_{SB}$  | -0.3 to +20                         | V    |
| Input Voltage C     | $V_{SC}$  | -0.3 to +20                         | V    |
| Power Dissipation   | $P_D$     | 200 ( $T_A \leq 85^\circ\text{C}$ ) | mW   |
| Storage Temperature | $T_{STG}$ | -55 to +125                         | °C   |

**NOTE:** Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

45

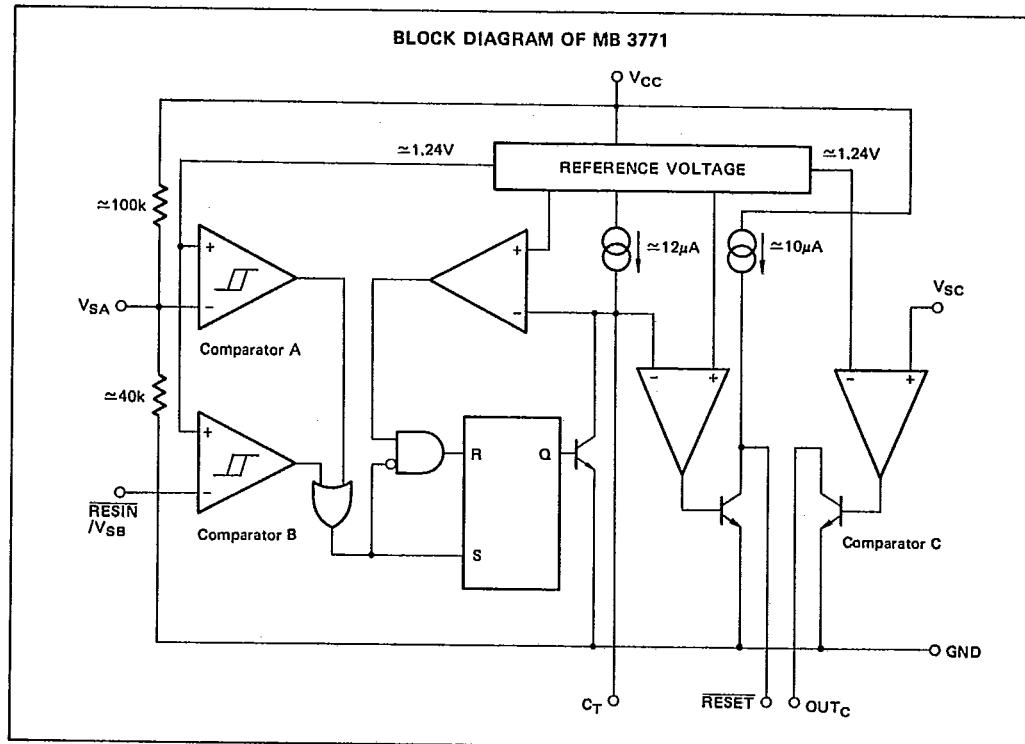

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

BLOCK DIAGRAM OF MB 3771

## FUNCTIONAL EXPLANATIONS

Detection voltage inputs A and B are connected to the inverting input of Comparators A and B respectively. Both comparators have built-in hysteresis. If either  $V_{SA}$  or  $V_{SB}$  drops lower than about 1.23V, then RESET goes low.

Comparator B is used for the arbitrary preset voltage detection (See Example 3), or as forced reset input for TTL logic level input. (See Example 6)

Comparator C is designed as an open-collector output with inverted polarity input/output characteristics. Comparator C has no hysteresis. It can be used for over-voltage detection (See Example 11), generation of RESET signal by positive

logic (See Example 7), and generation of reference voltage (See Example 10).

Note that  $V_{SS}$  and  $V_{SC}$  should be connected with  $V_{CC}$  and GND respectively. (See Example 1.)

The MB 3771 can detect about  $2\mu s$  voltage sag/surge of the power supply. The user can add delayed trigger capacity by connecting a capacitor between inputs  $V_{SA}$  and  $V_{SB}$ . (See Example 8)

Internal pull-up resistor on the RESET line provides for high impedance loading (i.e. CMOS logic).

## RECOMMENDED OPERATING CONDITIONS

| parameter                          | Symbol      | Value       | Unit |
|------------------------------------|-------------|-------------|------|
| Supply Voltage                     | $V_{CC}$    | +3.5 to +18 | V    |
| Output Current (RESET)             | $I_{RESET}$ | 0 to 20     | mA   |
| Output Current (OUT <sub>C</sub> ) | $I_{OUTC}$  | 0 to 6      | mA   |
| Operating Ambient Temperature      | $T_A$       | -40 to +85  | °C   |

## ELECTRICAL CHARACTERISTICS

DC Characteristics ( $V_{CC} = 5V$ ,  $T_A = 25^\circ C$ )

| Parameter                         | Condition                                   | Symbol          | Value |       |       | Unit |
|-----------------------------------|---|-----------------|-------|-------|-------|------|

FUJITSU  
MB 3771

T-73-53

Point 1: When  $V_{CC}$  rises to about 0.8V,  $\overline{RESET}$  goes low.

Point 2: When  $V_{CC}$  reaches  $V_S + V_{HYS}$ ,  $C_T$  then begins charging.  $\overline{RESET}$  remains low during this time.

Point 3:  $\overline{RESET}$  goes high when  $C_T$  begins charging.

$$T_{OP} \approx C_T \times 10^5 \text{ [ms]}$$

Point 4: When  $V_{CC}$  level drops lower than  $V_S$ , then  $\overline{RESET}$  goes low and  $C_T$  starts discharging.

Point 5: When  $V_{CC}$  level reaches  $V_S + V_{HYS}$ , then  $C_T$  starts charging.

In the case of voltage sagging, if the period from the time  $V_{CC}$  goes lower than or equal to  $V_S$  to the time  $V_{CC}$  reaches  $V_S + V_{HYS}$  again, is longer than  $t_{P1}$ , (as specified in the AC Characteristics),  $C_T$  is discharged and charged successively.

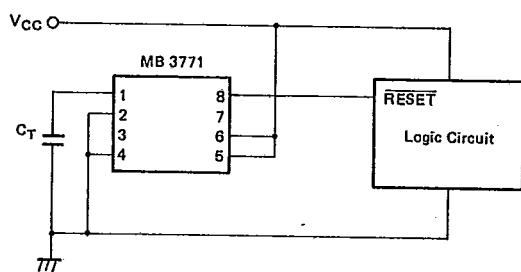

Point 6: After  $T_{OP}$  passes, and  $V_{CC}$  level exceeds  $V_S + V_{HYS}$ , then  $\overline{RESET}$  goes high.

Point 7: Same as Point 4.

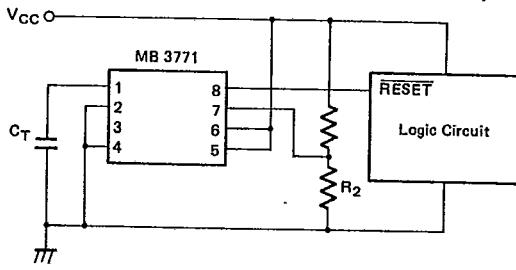

Point 8:  $\overline{RESET}$  remains low until  $V_{CC}$  drops below 0.8V.

**EXAMPLE 3: Arbitrary Voltage Supply Monitor**  
**Example 3b: Case:  $V_{CC} \geq 18V$**

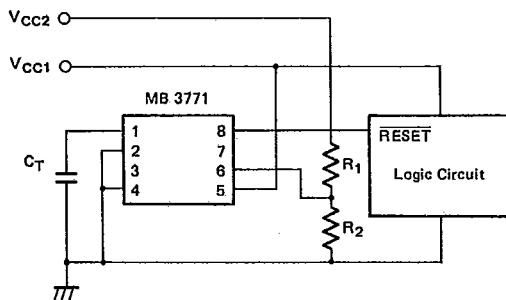

- **RESET** output levels range from 0V to 1V approximately. Device damage may occur if **RESET** exceeds its high level (1V).
- Output voltage and maximum **RESET** voltage levels are determined by resistor **R<sub>1</sub>** and **R<sub>2</sub>**.
- In this case, the 5V stabilized output can be used to power TTL circuitry.
- Using the chart below, the value of **R<sub>3</sub>** can be determined with respect to the output current.

| <b>V<sub>CC</sub></b><br>[V] | <b>Detection<br/>Voltage</b><br>[V] | <b>Min. V<sub>CC</sub></b><br>for adequate<br><b>RESET</b> [V] | <b>R<sub>1</sub></b><br>[MΩ] | <b>R<sub>2</sub></b><br>[kΩ] | <b>R<sub>3</sub></b><br>[kΩ] | <b>Output<br/>Current</b><br>[mA] |
|------------------------------|-------------------------------------|--|------------------------------|------------------------------|------------------------------|-----------------------------------|
| 140                          | 100                                 | 6.7  | 1.6                          | 20                           | 110                          | < 0.2                             |
| 100                          | 81                                  | 3.8  | 1.3                          | 20                           | 56                           | < 0.5                             |
| 40                           | 33                                  | 1.4  | 0.51                         | 20                           | 11                           | < 1.6                             |

NOTE: Resistor values are determined when  $I_{OUTC} = 100\mu A$ ,  $V_{OLC} = 0.4V$ . All resistor are 1/4W.

**EXAMPLE 4: 5V and 12V Power Supply Monitor ( $V_{CC1} = 5V$ ,  $V_{CC2} = 12V$ )**

NOTE: 5V is monitored by  $V_{SA}$ . Detection voltage is about 4.2V.

12V is monitored by  $V_{SB}$ . When  $R_1 = 390k\Omega$  and  $R_2 = 62k\Omega$ , Detection voltage is about 9.0V. Generally the detection voltage is determined by the following equation.

$$\text{Detection Voltage} = (R_1 + R_2) \cdot V_{SB}/R_2$$

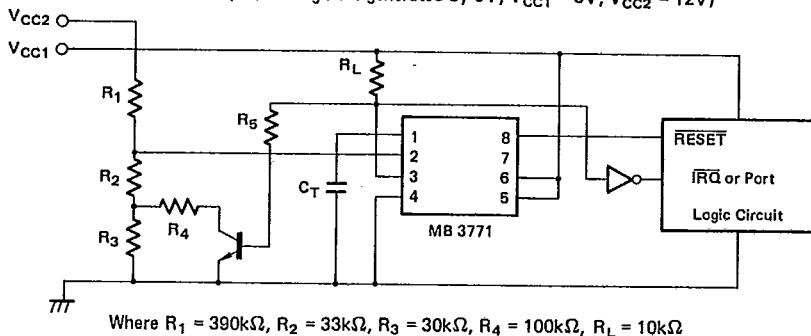

FUJITSU

MB 3771

MB 3771

**EXAMPLE 6: 5V and 12V Power Supply Monitor**  
 (RESET signal is generated by 5V,  $V_{CC1} = 5V$ ,  $V_{CC2} = 12V$ )

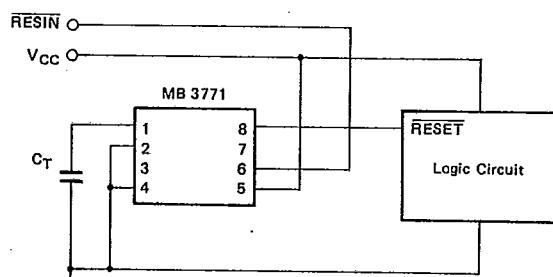

NOTE: 5V is monitored by  $V_{SA}$ , and generates RESET signal when  $V_{SA}$  detects voltage sagging. 12V is monitored by  $V_{SC}$ , and generates its detection signal at OUT<sub>C</sub>.

The detection voltage of 12V monitoring and its hysteresis is determined by the following equations.

$$\text{Detection voltage} = \frac{R_1 + R_2 + R_3}{R_2 + R_3} V_{SC} \text{ (8.95 volts in the circuit above)}$$

$$\text{Hysteresis width} = \frac{R_1 (R_3 - R_3 || R_4)}{(R_2 + R_3) (R_2 + R_3 || R_4)} V_{SC} \text{ (200mA in the circuit above)}$$

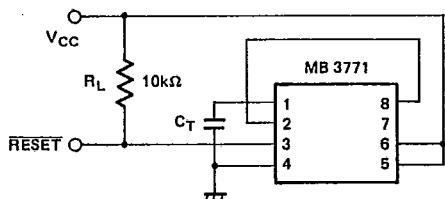

**EXAMPLE 6: 5V Power Supply Monitor with forced RESET input**

NOTE: RESIN is an TTL compatible input.

  
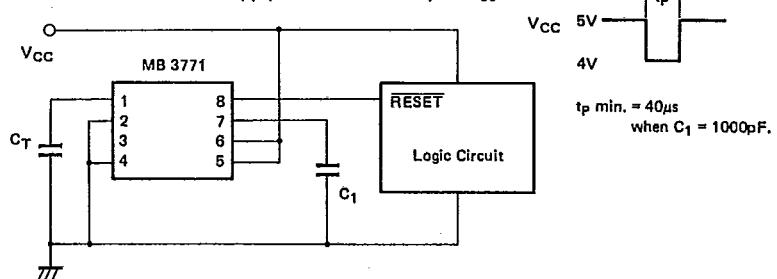

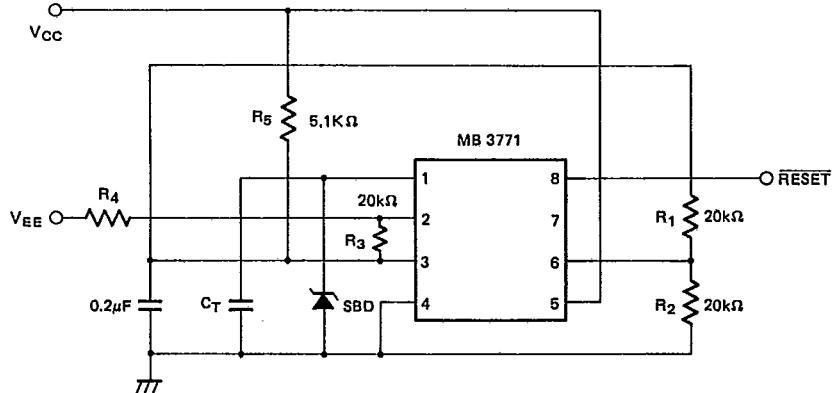

**FUJITSU**  
**MB 3771**

T-73-53

**EXAMPLE 7: 5V Power Supply Monitor with Non-inverted RESET**

NOTE: In this case, Comparator C is used to invert **RESET** signal. **OUT<sub>C</sub>** is an open-collector output.  
 $R_L$  is used as a pull-up resistor.

(4)

**EXAMPLE 8: 5V Power Supply Monitor with delayed trigger****EXAMPLE 9: 5V and arbitrary negative voltage Monitor**

NOTE: +5V and negative voltage are monitored at  $V_{CC}$  and  $V_{EE}$  respectively.  $R_1$ ,  $R_2$ , and  $R_3$  should be the same value. The negative detection voltage is determined by the following equation.

$$\text{Detection voltage } V_S = V_{SB} - V_{SB} \cdot R_4 / R_3$$

Example: When  $V_{EE} = -5V$  and  $R_4 = 91\text{k}\Omega$ ,  $V_S = -4.37V$ .

[4]

Using the reference table below, the value of R<sub>1</sub> can be determined. Where R<sub>2</sub> is 100kΩ, R<sub>3</sub> is 33kΩ, C<sub>1</sub> is 0.47μF.

Reference Table of R<sub>1</sub>, V<sub>CC</sub>, and the output current

| V <sub>CC</sub> [V] | R <sub>1</sub> [kΩ] | Output Current [mA] |
|---------------------|---------------------|---------------------|
| 40                  | 11                  | < 1.6               |
| 24                  | 6.2                 | < 1.4               |
| 15                  | 4.7                 | < 0.6               |

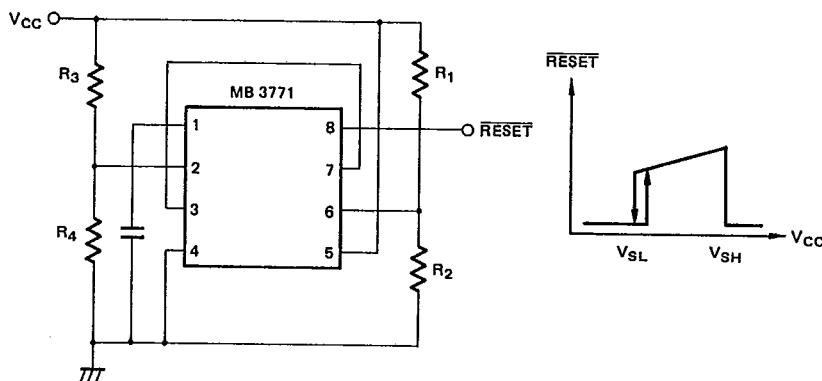

## Example 10d: 1.245V Reference Voltage Generation and 5V Monitoring

NOTE: Resistor R<sub>1</sub> determines Reference current. Using 1.2kΩ as R<sub>1</sub>, reference current is about 2mA.

**EXAMPLE 11: Low Voltage and Over Voltage Detection**

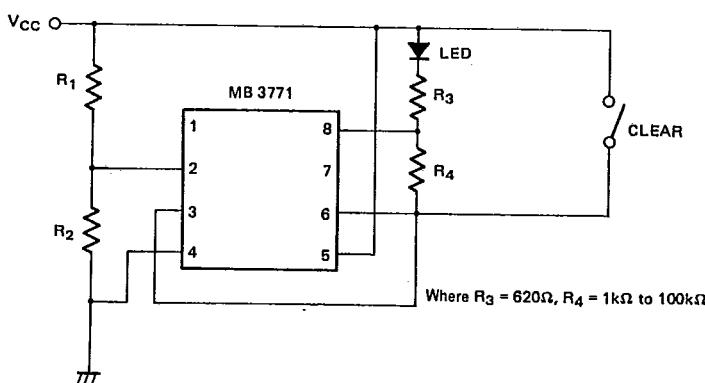

NOTE: V<sub>SH</sub> has no hysteresis. When over voltage is detected, RESET is held in the constant time as well as when low voltage is detected.

$$V_{SL} = (R_1 + R_2) \cdot V_{SB}/R_2$$

$$V_{SH} = (R_3 + R_4) \cdot V_{SC}/R_4$$

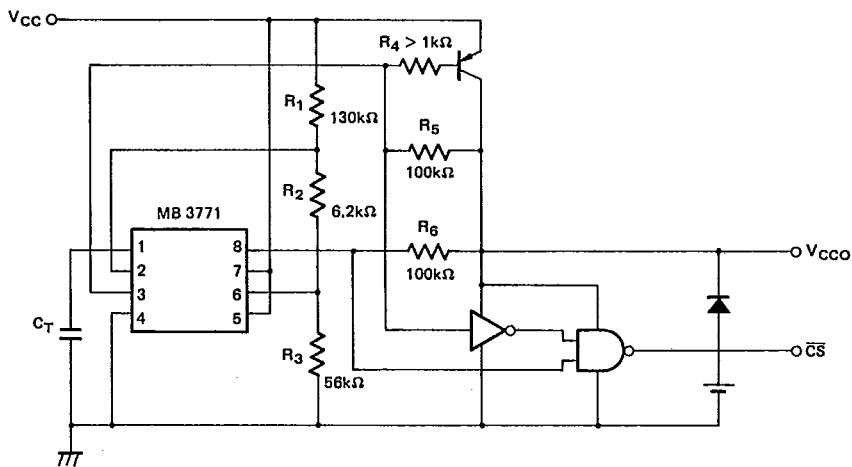

**EXAMPLE 12: Detection of Abnormal State of Power Supply System**

This example circuit detects abnormal low/over voltage of power supply voltage and is indicated by LED indicator. LED is reset by the CLEAR key.

NOTE: The detection levels of low/over voltages are determined by V<sub>SA</sub>, and R<sub>1</sub> and R<sub>2</sub> respectively.

T-73-53

EXAMPLE 13: Back-up power supply system ( $V_{CC} = 5V$ )

[4]

NOTE: Use CMOS Logic and connect  $V_{DD}$  of CMOS logic with  $V_{CC}$ .

The back-up battery works after  $\overline{CS}$  goes high as  $V_2 < V_1$ .

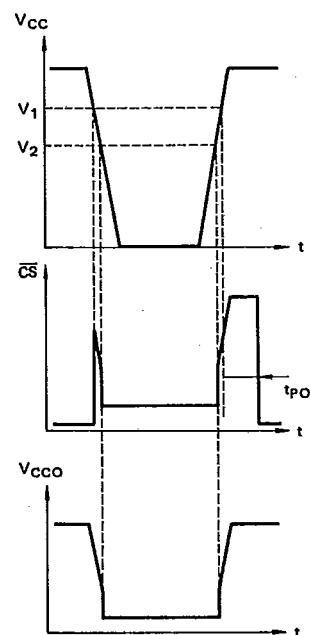

During  $t_{PO}$ , memory access is prohibited.

$CS$ 's threshold voltage  $V_1$  is determined by the following equation:

$$V_1 = (R_1 + R_2 + R_3) \cdot V_{SB}/R_3$$

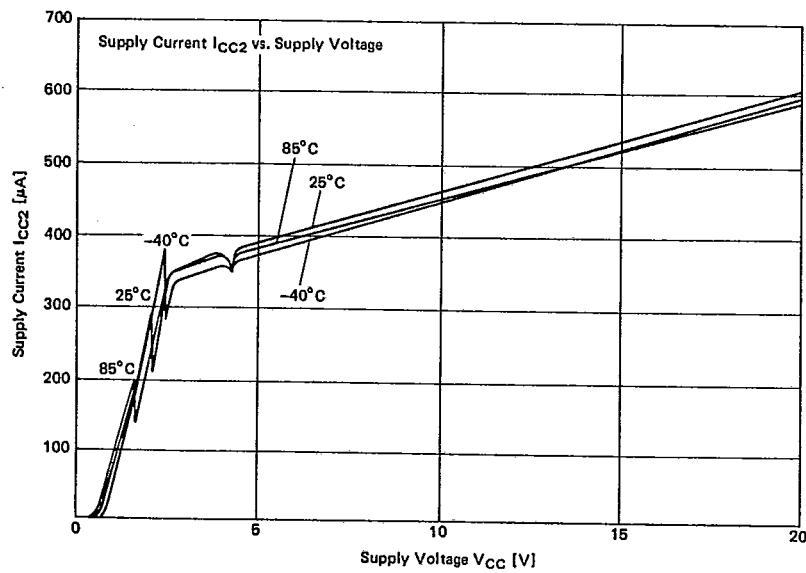

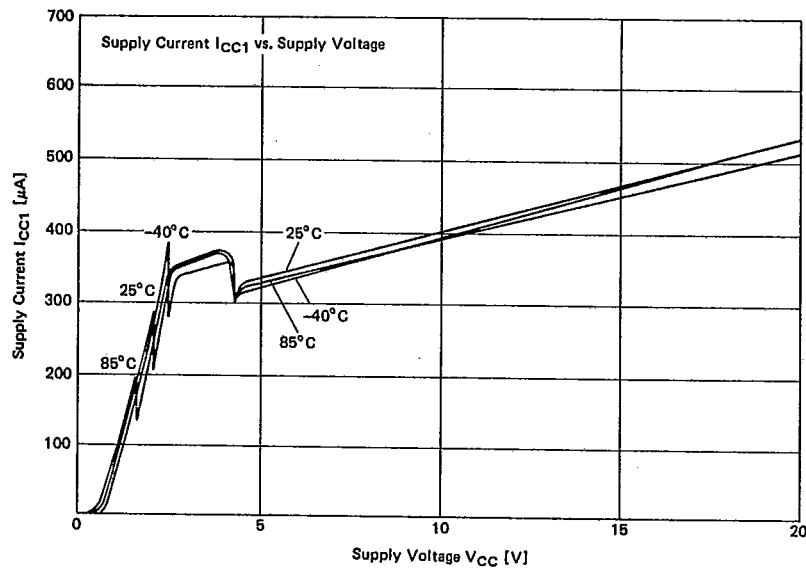

The voltage to change  $V_2$  is provided as the following equation:

$$V_2 = (R_1 + R_2 + R_3) \cdot V_{SC}/(R_2 + R_3)$$
