

MAXIM

CDMA + GPS LNA/Mixers

MAX2385/MAX2386

General Description

The MAX2385/MAX2386 LNA/mixer ICs are designed for CDMA/cdma2000 1x and GPS applications. The MAX2385/MAX2386 are optimized for the Japanese 832MHz to 870MHz band, and can also be configured for the Korean/Chinese/U.S. 869MHz to 894MHz band.

To optimize linearity and current consumption, the CDMA LNA comprises four gain states. The high-gain LNA has a reduced supply-current mode for use when no transmit (Tx) signal is present, and a high linearity mode, which minimizes Tx cross-modulation in the presence of a large interfering signal during talk mode. Two low-gain modes, provide higher cascade IIP3 at lower current. The lowest gain setting provides an LNA bypass and an ultra-low chip current of 4mA. This significantly extends the phone's standby time and lowers the overall current consumption of the phone.

Gain-switching hysteresis can be adjusted by selection of an off-chip resistor, which sets the current and linearity in each mode to customize switchover points.

In GPS mode, the MAX2386 LNA offers high gain and the MAX2385 features lower current consumption with lower gain. The CDMA paths of the MAX2385/MAX2386 are identical.

The MAX2385/MAX2386 include an on-chip LO divider, which enables the use of one VCO module for both cellular and GPS modes. An on-chip LO buffer to drive the Tx upconverter further reduces system complexity.

Applications

CDMA/cdma2000 1x Cellular Phones with GPS

Pin Configuration/Functional Diagram/Typical Operating Circuit appears at end of data sheet.

UCSP is a trademark of Maxim Products, Inc.

Features

- ◆ Low Average Current Consumption: 4.5mA (CDMA)
- ◆ +2.7V to +3.6V Operation
- ◆ 2.0dB Cascade GPS Noise Figure
- ◆ 2.5 dB Cascade CDMA Noise Figure
- ◆ Adjustable IIP3
- ◆ LO Output Buffer to Drive Tx Upconverter
- ◆ 1µA Shutdown Current
- ◆ Tiny 2.1mm × 2.7mm Chip-Scale Package (UCSP™)
- ◆ Single VCO for GPS and CDMA Operation
- ◆ LO Divider Improves Phase Noise/Desensitization

Ordering Information

PART	TEMP. RANGE	BUMP-PACKAGE
MAX2385EBP-T	-40°C to +85°C	5 × 4 UCSP*
MAX2386EBP-T	-40°C to +85°C	5 × 4 UCSP*

*Requires a special solder temperature profile described in the Absolute Maximum Ratings section.

Block Diagram

CDMA + GPS LNA/Mixers

ABSOLUTE MAXIMUM RATINGS

V _{CC} to GND	-0.3V to +4.3V	Thermal Resistance from Junction to Ambient	+80°C/W
Digital Input Voltage to GND	-0.3V to V _{CC} + 0.3V	Operating Temperature Range	-40°C to +85°C
RF Input Power	+12dBm	Junction Temperature	+150°C
Digital Input Current	±10mA	Storage Temperature Range	-65°C to +150°C
Continuous Power Dissipation		Bump Temperature (Soldering) (Note 1)	
5 × 4 UCSP (T _A = +70°C, derate 1.2mW/°C above		Infrared (15s)	+220°C
T _A = +70°C)	995mW	Vapor Phase (60s)	+215°C

Note 1: This device is constructed using a unique set of packaging techniques that impose a limit on the thermal profile the device can be exposed to during board level solder attach and rework. This limit permits only the use of the solder profiles recommended in the industry standard specification, JEDEC 020A, paragraph 7.6, Table 3 for IR/VPR and convection reflow. Preheating is required. Hand or wave soldering is not recommended.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = +2.7 to +3.6V, R_{BIAS} = 47kΩ, V_{IH} = +2.0V, V_{IL} = +0.6V, T_A = -40°C to +85°C. Typical values are at +2.75V and T_A = +25°C, unless otherwise noted.) (Note 2) (Table 1)

LO Output Power	BUFFEN = high, 100Ω load	-10	-7		dBm
LO Output Noise Power	45MHz to 55MHz offset		-145	-143	dBc/Hz
LO Buffer Reverse Isolation			35		dB

Note 2: DC characteristics are production tested at $T_A = +85^{\circ}C$. DC specifications over temperature are guaranteed by design and characterization.

Note 3: Specifications are guaranteed by design and characterization.

Note 4: Operation over this frequency range requires each port to be rematched for the desired operating range. Performance at various frequencies is indicated by the S-parameter data in the *Typical Operating Characteristics*.

Note 5: Operation outside this range is possible, although not guaranteed by design and characterization.

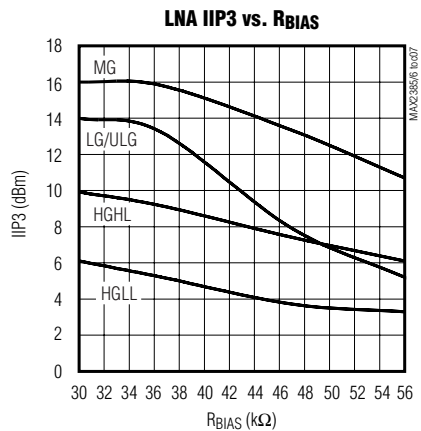

Note 6: Guaranteed by production test at f_{MAX} (870MHz) and T_{MAX} ($+85^{\circ}C$). For GPS mode, $f_{MAX} = 1575.42MHz$.

Note 7: Specifications are based on $R_{BIAS} = 47k\Omega$. I_{CC} for all LNAs and mixers is inversely proportional to R_{BIAS} . IIP3 can be traded for I_{CC} by selecting other values of R_{BIAS} . Two-tone IIP3 is measured with each tone input at the specified level separated by 900kHz.

CDMA + GPS LNA/Mixers

Typical Operating Characteristics

(MAX2385/MAX2386 EV kit, $V_{CC} = +2.75V$, $f_{RF} = 851MHz$ (CDMA), $f_{RF} = 1575MHz$ (GPS), $f_{LO} = 1482MHz$ (CDMA), $f_{LO} = 1465MHz$ (GPS), $P_{LO} = -10dBm$, $P_{MIXER} = -25dBm$ (CDMA), $P_{MIXER} = -35dBm$ (GPS), $P_{LNA(HGHL)} = -25dBm$, $P_{LNA(HGLL)} = -30dBm$, $P_{LNA(MG)} = P_{LNA(LG)} = -20dBm$, $P_{LNA(GPS)} = -35dBm$, $R_{BIAS} = 47k\Omega$, and $T_A = +25^\circ C$, unless otherwise noted.)

Pin Configuration/Functional Diagram/Typical Operating Circuit

Pin Description

PIN	NAME	FUNCTION
A1	GLNAOUT	GPS LNA Output Port. This port requires an external pullup inductor and series blocking capacitor, which are part of the matching network.
B1	CLNAOUT	CDMA LNA Output Port. This port requires an external pullup inductor and series blocking capacitor, which are part of the matching network.
C1	GLNAIN	GPS RF Input Port. Requires a blocking capacitor.
D1	GND	Ground
A2, A4	GIF+, GIF-	GPS Differential Output Port. Requires pullup inductors and blocking capacitors, which are used as part of the matching network.
B2	G1	Logic Input (Table 1)
C2	RBIAS	Bias Setting Pin. The DC voltage at this pin is a bandgap voltage (+1.2V). For nominal bias, connect 47kΩ resistor to ground. The value of this resistor can be adjusted to alter the linearity of the LNAs and mixers in all modes. See Figures 2 and 3 for resistor switching application circuits.
D2	CLNAIN	Cellular RF Input Port. Requires a blocking capacitor.
A3	GMIXIN	GPS Mixer Input Port. Requires a series blocking capacitor.
B3	MODE	Logic Input (Table 1)

CDMA + GPS LNA/Mixers

MAX2385/MAX2386

Pin Description (continued)

PIN	NAME	FUNCTION
C3	G2	Logic Input (Table 1)
D3	V _{CC}	+2.7 to +3.6V Supply Pin. Bypass with 100pF capacitor as close to the pin as possible.
B4, C4	CIF-, CIF+	CDMA Differential Output Port. Requires pullup inductors and blocking capacitors, which are used as part of the matching network.
D4	GND	Ground
A5	CMIXIN	CDMA Mixer Input Port. Requires a series blocking capacitor.
B5	GND	Ground
C5	LO_OUT	LO Buffer Output Port. Internally matched to 100Ω. Requires a series blocking capacitor.
D5	LO_IN	LO Input Port. Also LO buffer enable (BUFFEN). Apply logic signal through 10kΩ resistor. Set LO_IN high to enable the LO_OUT port. Set low to disable the LO_OUT port. AC-couple the LO input and DC-couple the buffer enable signal (see <i>Typical Operating Circuit</i>).

Detailed Description

The MAX2385/MAX2386 are ideal for CDMA + GPS applications. These devices contain two LNA/mixer pairs: one pair for CDMA operation and one pair for GPS operation. The MAX2385/MAX2386 feature seven modes of operation, including shutdown. Table 1 depicts each mode along with the corresponding LNA and mixer configuration.

These devices are ideal for Japanese cdma2000 1x applications. The RF frequency range is from 832MHz to 870MHz, and the IF frequency range is from 70MHz to 200MHz. In GPS mode, the RF frequency is

1575.42MHz. These devices can also be used for the Korean/Chinese/U.S. 869MHz to 894MHz band.

CDMA LNA

The MAX2385/MAX2386 have four modes of CDMA LNA operation: high gain, high linearity (HGHL); high gain, low linearity (HGLL); midgain (MG); and low gain (LG). The logic inputs MODE, G1, and G2 allow selection between these modes (Table 1). Use HGHL mode when extra-high linearity is required for cross-modulation suppression. When cross-modulation is not a concern or the transmitter is off, use HGLL mode. In MG mode, the device is designed to meet CDMA linearity with interferers at -32dBm/tone. When

CDMA + GPS LNA/Mixers

receiving large signals, use LG mode to significantly reduce current consumption (see the *RBIAS Switching* section).

CDMA Downconverter

The CDMA mixer has four modes of operation for optimal performance and current conservation. The logic inputs MODE, G1, and G2 allow selection between the different modes (Table 1).

The mixer output appears at the differential CIF+ and CIF- pins. Each of these open-collector outputs requires an external pullup inductor to VCC for DC biasing. This port requires a matching network for coupling to an external IF filter.

To further reduce board complexity, the CDMA and GPS mixer outputs can be combined, eliminating one of the IF filters (Figure 1).

LO Output Buffer

The LO_IN pin controls the LO output buffer. This pin turns the open-collector LO output buffer on and off to conserve current consumption as needed (see *Pin Description* and *Typical Operating Circuits*).

RF Inputs

The mixer inputs CMIX_IN and GMIX_IN are typically connected to the LNA output through an off-chip image-reject bandpass filter. The LNA inputs and outputs require external matching networks to 50Ω.

Applications Information

RBIAS Switching

Figures 2 and 3 show more sophisticated methods of varying the bias currents in different modes of operation. By adding a shunt resistor to RBIAS, the user can increase or decrease the total bias resistance (and therefore the bias current) in different modes, keeping in mind that the voltage at the RBIAS pin is +1.2V. Figure 2 uses a shunt resistor to decrease the total bias resistance (when RSHUNT is tied low). This method uses an additional DSP I/O control line. To avoid adding an extra I/O line to the system, the user can use the existing logic lines (MODE, G1, and G2). Figure 3 utilizes the G1 control pin, a transistor, and an additional resistor to change the bias current in certain modes. Both figures are simple ways to accommodate a wide range of power schemes.

Figure 3. Variable Bias Current Application Circuit with Shunt Resistor and Transistor (Using 3 DSP I/O Ports)

Layout

For the MAX2385/MAX2386, keep RF signal lines as short as possible to minimize losses and radiation. Always use controlled-impedance lines on all high-frequency inputs and outputs and use low-inductance connections to ground on all GND pins. At the mixer outputs, keep the differential lines together and of the same length to ensure signal balance.

For the best gain and noise performance, use high-Q (greater than 40) components for the LNA input matching circuit.

For the power supplies, a star topology works well to isolate different sections of the device. Each V_{CC} node has its own path to a central V_{CC} ; place decoupling capacitors that provide low impedance at the RF frequency of interest close to all V_{CC} connections. The central V_{CC} should have a large decoupling capacitor as well. (Use the MAX2385/MAX2386 EV kit as an example.)

UCSP Reliability

The UCSP represents a unique package that greatly reduces board space compared to other packages. UCSP reliability is integrally linked to the user's assembly methods, circuit board material, and usage environ-

ment. Operating Life and Moisture Resistance remain uncompromised as they are primarily determined by the wafer-fabrication process. Mechanical stress performance is a greater consideration for a UCSP. UCSP solder joint contact integrity must be considered since the package is attached through direct solder contact to the user's PC board. Testing done to characterize the UCSP reliability performance shows that it is capable of performing reliably through environmental stresses. Results of environmental stress tests and additional usage data and recommendations are detailed in the UCSP application note, which can be found on Maxim's website, www.maxim-ic.com.
