Display on/off	W		6		4	3	2	1		1/0	Controls display on/off. RAM data and internal status are not affected.
Display start line	0	0	1	1	Display start line (0-63)						Specifies the RAM line displayed at the top of the screen.
Set Page (x address)	0	0	1	0	1	1	1	Page (0-7)			Sets the page (X address) of RAM at the page (X address) register.
Set Y address	0	0	0	1	Y address (0-63)						Sets the Y address in the Y address in the counter.
Status read	1	0	Busy	0	ON/OFF	Reset	0	0	0	0	Reads the status. Reads 1: Reset 0: Normal ON/OFF 1: Display off 0: Display on Busy 1: Internal operation 0: Ready

Detailed Explanation

Display On/Off

	R/W	D/I	DB7.....DB0							
Code	0	0	0	0	1	1	1	1	1	D
	MSB				LSB					

The display data appears when D is 1 and disappears when D is 0. Though the data is not on the screen with D=0, it remains in the display data RAM. Therefore, you can make it appear by changing D=0 into D=1.

Display Start Line

	R/W	D/I	DB7.....DB0								
Code	0	0	1	1	A	A	A	A	A	A	
				MSB				LSB			

Z address AAAAAA (binary) of the display data RAM is set in the display start line register and displayed at the top of the screen. Figure 1 shows examples of display (1/64 duty cycle) when the start line=0-3. When the display duty cycle is 1/64 or more (ex. 1/32, 1/24 etc.), the data of total line number of LCD screen, from the line specified by display start line instruction, is displayed.

Set page (X address)

	R/W	D/I	DB7.....DB0								
Code	0	0	1	0	1	1	1	A	A	A	
				MSB				LSB			

X address AAA (binary) of the display data RAM is set in the X address register. After that, writing or reading to or from MPU is executed in this specified page until the next page is set. See figure 2.

Set Y Address

	R/W	D/I	DB7.....DB0								
Code	0	0	0	1	A	A	A	A	A	A	
				MSB				LSB			

Y address AAAAAA (binary) of the display data RAM is set in the Y address Counter. After that, Y address counter is increased by 1 every time the data is written or read to or from MPU.

Status Read

	R/W	D/I	DB7.....DB0								
Code	1	0	BUSY	0	ON/OFF	REST	0	0	0	0	
				MSB				LSB			

- Busy

When busy is 1, the LSI is executing internal operations. No instructions are accepted while busy is 1, so you should make sure that busy is 0 before writing the next instruction.

POWERTIP TECHNOLOGY CORPORATION

DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

- ON/OFF

Shows the liquid crystal display conditions: on condition or off condition.

When on/off is 1, the display is in off condition.

When on/off is 0, the display is in on condition.

- RESET

RESET=1 shows that the system is being initialized. In this condition, no instructions except status read can be accepted.

RESET=0 shows that initializing has finished and the system is in the usual operation condition.

Write Display Data

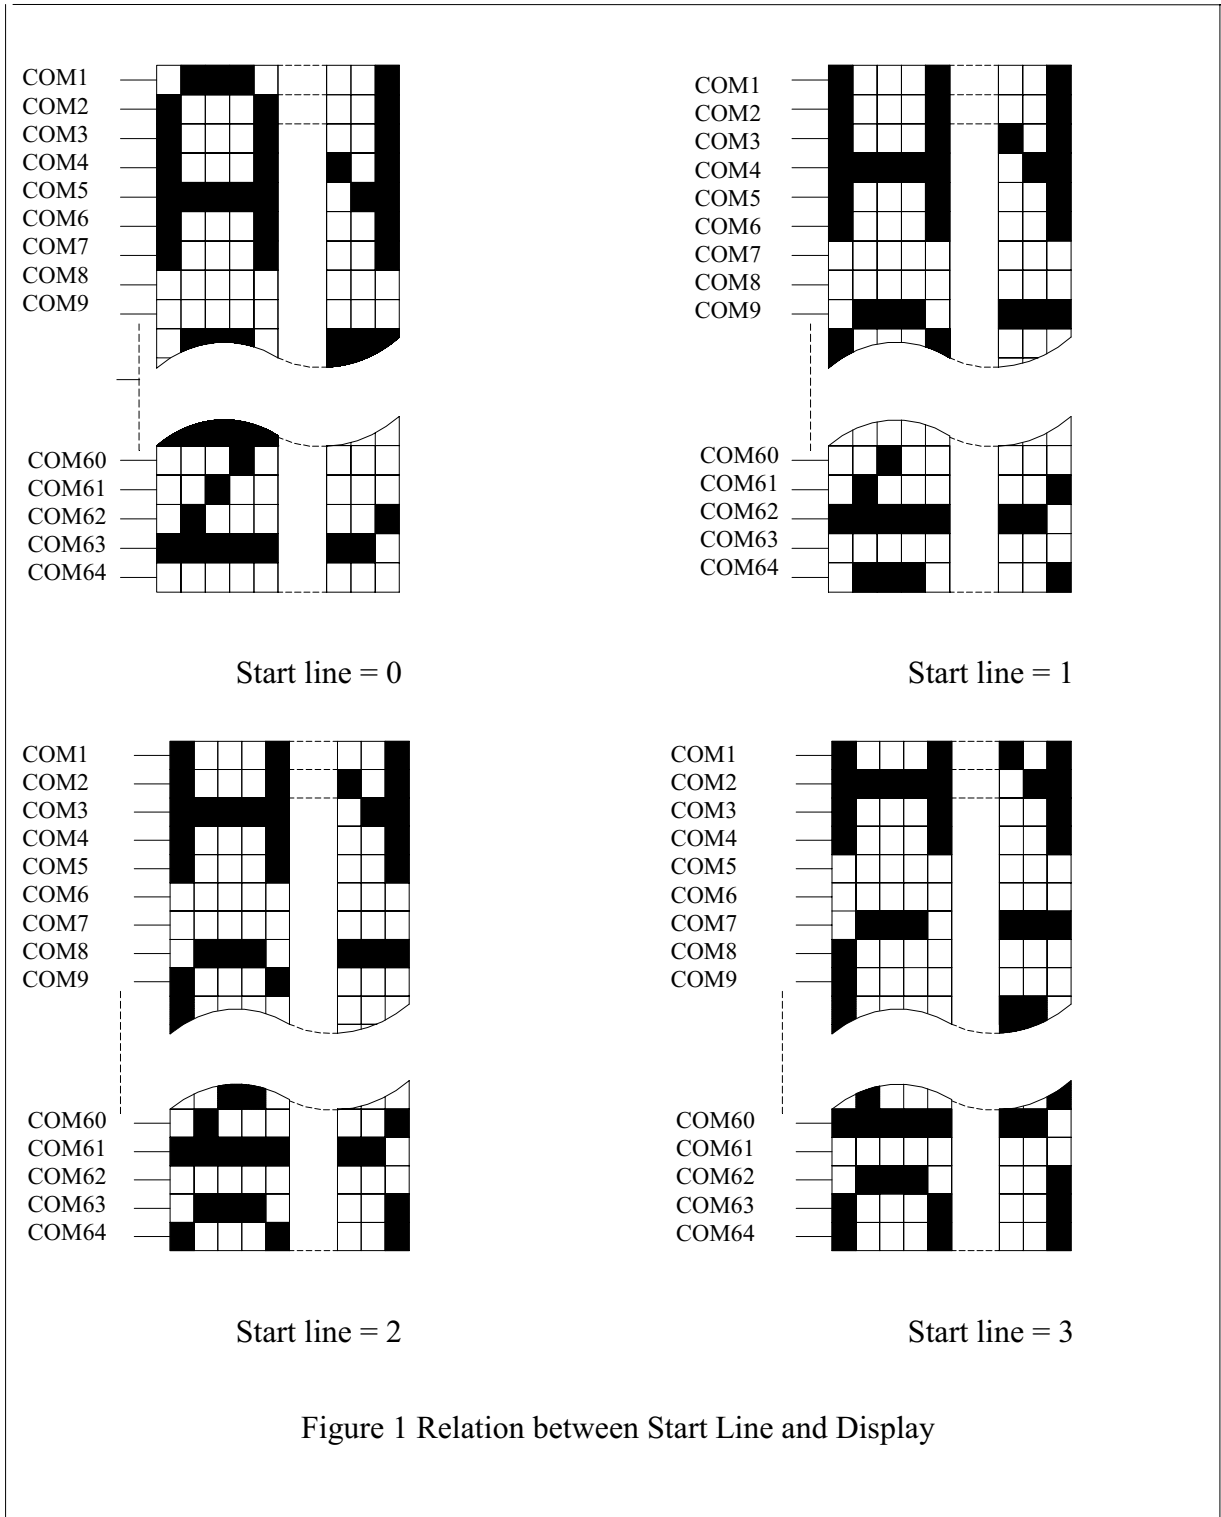

Write 8-bit data DDDDDDDD (binary) into the display data RAM. Then Y address is increased by 1 automatically.

Read Display Data

Reads out 8-bit data DDDDDDDD (binary) from the display data RAM. Then Y address is increased by 1 automatically.

One dummy read is necessary right after the address setting. For details, refer to the explanation of output register in “Function of Each Block”.
