			Code									
Display on/off	0	0	0	0	1	1	1	1	1	1/0	Controls display on/off. RAM data and internal status are not affected. (0:OFF,1:ON)	
Display start line	0	0	1	1	Display start line (0-63)						Specifies the RAM line displayed at the top of the screen.	
Set Page (x address)	0	0	1	0	1	1	1	Page (0-7)			Sets the page (X address) of RAM at the page (X address) register.	
Set Y address	0	0	0	1	Y address (0-63)						Sets the Y address in the Y address counter.	
Status read	1	0	Busy	0	ON/ OFF	Reset	0	0	0	0	Reads the status. Reset 1: Reset 0: Normal ON/OFF 1: Display off 0: Display on Busy 1: Internal operation 0: Ready	
Write display data	0	1	Write data								Writes data DB0 (LSB) to DB7 (MSB) on the data bus into display RAM.	Has access to the address of the display RAM specified in advance. After the access, Y address is increased by 1.
Read display data	1	1	Read data								Reads data DB0 (LSB) to DB7 (MSB) from the display RAM to the data bus.	

Detailed Explanation

Display On/Off

R/W D/I   DB7………………………………….DB0

Code	0	0	0	0	1	1	1	1	1	D
		MSB								LSB

The display data appears when D is 1 and disappears when D is 0. Though the data is not on the screen with D=0, it remains in the display data RAM. Therefore, you can make it appear by changing D=0 into D=1.

Display Start Line

Code	R/W	D/I	DB7							DB0
	0	0	1	1	A	A	A	A	A	A

MSB   LSB

Z address AAAAAA (binary) of the display data RAM is set in the display start line register and displayed at the top of the screen. Figure 1 shows examples of display (1/64 duty cycle) when the start line=0-3. When the display duty cycle is 1/64 or more (ex. 1/32, 1/24 etc.), the data of total line number of LCD screen, from the line specified by display start line instruction, is displayed. See figure 1.

Set page (X address)

Code	R/W	D/I	DB7							DB0
	0	0	1	0	1	1	1	A	A	A

MSB   LSB

X address AAA (binary) of the display data RAM is set in the X address register. After that, writing or reading to or from MPU is executed in this specified page until the next page is set. See figure 2.

Set Y Address

Code	R/W	D/I	DB7							DB0
	0	0	0	1	A	A	A	A	A	A

MSB   LSB

Y address AAAAAA (binary) of the display data RAM is set in the Y address Counter. After that, Y address counter is increased by 1 every time the data is written or read to or from MPU.

Status Read

Code	R/W	D/I	DB7							DB0
	1	0	Busy	0	ON/OFF	Reset	0	0	0	0

MSB   LSB

• Busy

When busy is 1, the LSI is executing internal operations. No instructions are accepted while busy is 1, so you should make sure that busy is 0 before writing the next instruction.

POWERTIP TECHNOLOGY CORPORATION
DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

• ON/OFF

Shows the liquid crystal display conditions: on condition or off condition.

When on/off is 1, the display is in off condition.
When on/off is 0, the display is in on condition.

• RESET

RESET=1 shows that the system is being initialized. In this condition, no instructions except
 status read can be accepted.
RESET=0 shows that initializing has finished and the system is in the usual operation condition.

Write Display Data

	R/W	D/I	DB7	....	....	....	....	....	....	DB0
Code	0	1	D	D	D	D	D	D	D	D
			MSB							LSB

Write 8-bit data DDDDDDDD (binary) into the display data RAM. Then Y address is increased
 by 1 automatically.

Read Display Data

	R/W	D/I	DB7	....	....	....	....	....	....	DB0
Code	1	1	D	D	D	D	D	D	D	D
			MSB							LSB

Reads out 8-bit data DDDDDDDD (binary) from the display data RAM. Then Y address is
 increased by 1 automatically.
One dummy read is necessary right after the address setting. For details, refer to the explanation of
 output register in "Function of Each Block".
