GL393/393A
LOW POWER, LOW OFFSET
VOLTAGE DUAL COMPARATORS

Description

The GL393 consists of two independent precision voltage comparators designed specifically to operate from a single power supply. Operation from split power supplies is also possible and the low power supply current drain is independent of the supply voltage range, Darlington connected pnp input stage allows the input common-mode voltage to include ground.

Pin Configuration
Features

- Single Supply Operation +2.0V to +36V
- Dual Supply Operation ±1.0V to ±18V
- Compatible with All forms of Logic
- Allow Comparison of Voltages Near Ground Potential
- Low Current Drain 400 μA TYP
- Low Input Bias Current 25nA TYP
- Low Input Offset Current ±5 nA TYP
- Low Offset Voltage ±2mV

Absolute Maximum Ratings

Supply Voltage, V⁺	+36V or ±18V
Differential Input Voltage	36V
Input Voltage Range	−0.3V to +36V
Power Dissipation	500mW
Input Current (V_{IN} < −0.3V)	50 mA
Operating Temperature Range	0°C to +70°C
Storage Temperature Range	−55°C to +125°C
Pin Temperature	260°C

Differential Input Voltage	All V$_{IN}$≥0V (or V⁻ if split supply is used) 0°C≤T$_A$≤70°C			V⁺				V⁺	V

Notes: (1) The direction of the current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output, so no loading change exists on the reference or input lines.

(2) If either input of any comparators goes more negative than 0.3V below ground, a parasitic transistor turns on causing high input current and possible faulty outputs. This conditions is not destructive providing the input current is limited to less than 50mA.

(3) The response time specified is for a 100mV input step with 5mV overdrive. For larger overdrive signals 300 nsec can be obtained.

Applications

These dual comparators feature high gain, wide band width characteristics. This gives the device oscillation tendencies if the outputs are capacitively coupled to the inputs via stray capactiance. This oscillation manifests itself during output transitions (V_{OL} to V_{OH}). To alleviate this situation input resistors < 10kΩ should be used. The addition of positive feedback (<10mV) is also recommended. It is good design practice to ground all unused pins. Differential input voltages may be larger than supply voltage without damaging the comparator's input voltages. More negative than −0.3V should not be used.

D1 prevents input from going negative by more than 0.6V

$$R1 + R = R3$$

$$R3 < \frac{R5}{10} \text{ for small error in zero crossing}$$
