#### ⑥ Inductance

Expressed by three figures. The unit is micro-henry (μH). The first and second figures are significant digits, and the third figure expresses the number of zeros which follow the two figures. If there is a decimal point, it is expressed by the capital letter "R". In this case, all figures are significant digits. If inductance is less than 0.1μH, the inductance code is expressed by a combination of two figures and the capital letter "N", and the unit of inductance is nano-henry (nH). The capital letter "N" indicates the unit of "nH", and also expresses a decimal point. In this case, all figures are significant digits.

## High Frequency Monolithic Type LQG15H/LQG18H Series

### LQG15HS Series

The LQG15HS series are chip inductors specifically designed for high frequency applications. The LQG15H series is designed to realize stable characteristics in high frequency range applying integrated multilayer process. The integrated multilayer process enables a wide range of inductance values with tight tolerance. Since recent mobile phone installment, Color LCD and Camera module, the power consumption becomes higher. In order to reduce power consumption low DC resistance is strongly required. The LQG15HS has achieved the lowest DC resistance.

#### ■ Features

1. High-Q, stable inductance in high frequency is achieved by the original structure that minimizes stray capacitance. It is suitable for the high frequency circuits of mobile communication equipment.
2. The small size of LQG15H (1.0x0.5x0.5mm) is suitable for small and low profile mobile equipment.
3. The external electrodes with nickel barrier structure provide excellent solder heat resistance.
4. Wide variation in inductance value
  - 1-10nH (E24 step)
  - 10-120nH (E12 step)
5. Lead Free

#### ■ Applications

1. High frequency circuits of mobile phones such as PA, ANT, VCO, SAW, etc.
2. Mobile phones such as GSM, CDMA, PDC, etc.
3. "Bluetooth"

## High Frequency Winding Type LQW15A/LQW18A Series

### LQW15A\_00 Series

The LQW15A series consists of air core chip coil using a miniature alumina core.  
 The tight inductance tolerance (+-0.2nH, +-3%) is available due to Murata's original winding technology.  
 The LQW15A series has high Q value in high frequency range and high self resonant frequency. It is suitable for high frequency circuits which are used in telecommunication equipment.

#### ■ Features

1. Horizontal winding structure enables tight inductance tolerance (+-0.2nH, +-3%)
2. The subminiature dimensions (1.0x0.5mm) allow high density mounting.
3. The high self resonant frequency realizes high Q value and stable inductance at high frequency.
4. Low DC resistance design is ideal for low loss, high output and low power consumption.
5. Resin-coated surface enables excellent mounting.

#### ■ Applications

1. High frequency circuits of mobile phones such as PA, ANT, VCO, SAW, etc.
2. Mobile phones such as GSM, CDMA, PDC, etc.
3. "Bluetooth"
4. W-LAN
5. High frequency circuits in general

# Chip Coils

## High Frequency Winding Type LQW2BH/LQW31H Series

LQW2BH series consists of air-core chip coil using a sub-miniature alumina core as a bobbin.

### ■ Features

1. Inductance range from 2.7 to 470nH
2. Their high self-resonant frequency characteristic yields a high Q value and highly stable inductance at high frequencies.
3. Low DC resistance design enables handling of higher rated current.
4. The series has excellent solder heat resistance. Both flow and reflow soldering methods can be employed.
5. LQW2BH\_03/\_13  
Does not contain lead.  
LQW2BHN\_D/\_J/\_K  
Inductance tolerance  $\pm 0.5\text{nH}$  (8.2nH max.),  $\pm 5\%$  (10 to 220nH),  $\pm 10\%$  (270 to 470nH) is realized.  
The sub miniature dimensions (2.0x1.5mm) allow high density mounting.  
LQW2BHN\_G (Tight inductance tolerance)  
Tight inductance tolerance of  $\pm 2\%$  is available.  
LQW2BHN\_13 (High Q/Low DC Resistance Type)  
LQW2BHN\_13 using thick wire (0.12mm in diameter) has higher Q value than existing LQW2BH series.  
Low DC resistance design enables handling of higher current. Inductance range from 2.7 to 27nH.

### ■ Applications

High frequency circuit in telecommunication equipment, such as DECT, PHS, PCS, PCN, GSM and CDMA  
 Impedance Matching -- Power-AMP Module (PA)  
 SAW filter  
 Resonance circuits -- VCO

### LQM21D Series

The LQM21D series consists of magnetically shielded chip inductors. It has less than half the DC resistance of our conventional monolithic chip inductors as well as high inductance.

Dimension of t	Inductance : 1.0 to 10 $\mu$ H	0.85 $\pm$ 0.2
	Inductance : 22 to 47 $\mu$ H	1.25 $\pm$ 0.2

#### ■ Features

1. The inductors have very low DC resistance.
2. The series has an inductance range of 1.0 micro H to 47 micro H.
3. Magnetically shielded structure provides excellent crosstalk characteristics.
4. Compact (2.0x1.25mm) and lightweight
5. Outstanding solder heat resistance. Either flow or reflow soldering methods can be employed.

## Notice (Soldering and Mounting)

### 2. Standard Soldering Conditions

#### (1) Soldering method

Chip coils can be flow or reflow soldered.

Please contact Murata regarding other soldering methods.

As for LQG, LQP, LQW15A/18A, LQH3KS/55D/66S series, please use reflow soldering.

#### (2) Soldering Temperature and Time

Solder within the temperature and time combinations indicated by the slanted lines in the following graphs. If soldering is repeated, please note that the allowed time is the accumulated time.

Solder : Use H60A, H63A(JIS Z 3282) or equivalent.

Use solder paste equivalent to H60A for LQP03T/15M/15T/18M and LQG15H/18H.

Flux : Use rosin-based flux, but not strongly acidic flux (with chlorine content exceeding 0.2wt%).  
 Do not use water-soluble flux.

##### Reflow Soldering

## Notice (Soldering and Mounting)

☐ Continued from the preceding page.

### (4) Reworking with Soldering Iron

Preheating at 150°C for 1 minute is required. Do not directly touch the ceramic element with the tip of the soldering iron. The reworking soldering conditions are as follows:

- Soldering iron power output : 30W max.
- Temperature of soldering iron tip : 280°C
- Diameter of soldering iron end : 3.0mm max.
- Soldering time : within 3 s

### 3. Mounting Instructions

#### (1) Land Pattern Dimensions

Large lands reduce Q of the mounted chip. Also, large protruding land areas (bordered by lines having dimensions 'c' and 'd' shown below) cause floating and electrode leaching.

#### (2) Magnetic Coupling

Since some chip coils are constructed like an open magnetic circuit, narrow spacing between coils may cause magnetic coupling.

The LQG and LQM LQH3KS/66S series have a magnetically shielded structure. The structure makes their coupling coefficient smaller than that of conventional chip coils.

#### (3) PCB Warping

PCB should be designed so that products are not subjected to the mechanical stress caused by warping the board.

Products should be located in the sideways direction (Length:  $a < b$ ) to the mechanical stress.

#### (4) Amount of Solder Paste

Excessive solder causes electrode corrosion, while insufficient solder causes low electrode bonding strength. Adjust the amount of solder paste so that solder is applied as shown on the right.

- Standard thickness of solder paste
- LQP/LQG/LQM/LQW\_A : 100 to 150μm
- LQH/LQW\_H : 200 to 300μm

Continued on the following page. ☐

## Notice (Soldering and Mounting)

☐ Continued from the preceding page.

### (5) Amount of Adhesive

If too much adhesive is applied, then it may overflow into the land or termination areas and yield poor solderability. In contrast, if insufficient adhesive is applied, or if the adhesive is not sufficiently hardened, then the chip may become detached during flow soldering. Apply the adhesive in accordance with the following conditions:

**LQH\_C/H/M/N  
LQW\_H**

**LQP/LQG/LQM**

### 4. Cleaning

The following conditions should be observed when cleaning chip coils:

- (1) Cleaning Temperature : 60°C max. (40°C max. for alcohol cleaning agents)
- (2) Ultrasonic
  - Output : 20W/l max.
  - Duration : 5 minutes max.
  - Frequency : 28 to 40kHz
  - Care should be taken not to cause resonance of the PCB and mounted products.
- (3) Cleaning agent
 

The following cleaning agents have been tested on individual components. Evaluation in complete assembly should be done prior to production.

  - a) Alcohol cleaning agents
    - Isopropyl alcohol (IPA)

#### b) Aqueous cleaning agents

- Surface active agent (Clean Thru 750H \*1)
  - High grade alcohol (Pine Alpha ST-100S \*1)
  - Hydrocarbon (Techno Cleaner 375)
  - Alkaline Saponifier (Aqua Cleaner 210SEI \*2)
- LQH, LQH\_S series : Aqueous agents should not be used because they may cause quality deterioration.
- \*1 LQH series : Surface active agent and high grade alcohol can be used.
  - \*2 cleaner should be diluted to 15% using deionized water.

- (4) Ensure that flux residue is completely removed. Component should be thoroughly dried after aqueous agents have been removed with deionized water. For additional cleaning methods, please contact Murata.

## Notice

### ■ Notice (Storage and Operating Conditions)

#### < Operating Environment >

Do not use products in chemical atmosphere such as chlorine gas, acid or sulfide gas.

#### < Storage Requirements >

##### 1. Storage Period

LQG/LQM series should be used within 6 months; the other products should be used within 12 months. Solderability should be checked if this period is exceeded.

##### 2. Storage conditions

(1) Store products in a warehouse in compliance with the following conditions :

Temperature : -10 to 40 degree C.

Humidity : 30 to 70% (relative humidity)

Do not subject products to rapid changes in temperature and humidity.

Do not store them in chemical atmospheres such as one containing sulfurous acid gas or alkaline gas.

This will prevent electrode oxidation which causes poor solderability and possible corrosion of coils.

(2) Do not store products in bulk packaging to prevent collision among coils which causes core chipping and wire breakage.

(3) Store products on pallets to protect from humidity, dust, etc.

(4) Avoid heat shock, vibration, direct sunlight, etc.

### ■ Notice (Handling)

This item is designed to have sufficient strength, but handle with care to avoid chipping or breaking its ceramic structure.

#### LQW\_A series

- To prevent breaking the wire, avoid touching sharp material, such as tweezers, to the winding portion.
- To prevent breaking the core, avoid applying excessive mechanical shock to products mounted on the board."
- In some mounting machines, when picking up components, support pin pushes up the components from the bottom of base tape. In this case, please remove the support pin. The support pin may damage the components and break wire.

#### LQH\_C/D/H/M/N, LQW\_H series

- To prevent breaking the wire, avoid touching sharp material, such as tweezers, to the winding portion.
- To prevent breaking the core, avoid applying excessive mechanical shock to products mounted on the board.

#### LQP series

- The pattern of the chip coil is covered with protective film. Take care to avoid damaging the chip coil when handling it with pick-up nozzles,

sharp instruments, etc.

#### LQM series

- There is the possibility that magnetism may change the inductance value. Do not use a magnet or tweezers with magnetism when handling chip coils. (The tip of the tweezers should be molded with resin or pottery.)

#### < Handling >

1. Avoid applying excessive stress to products to prevent damage.
2. Do not touch winding with sharp objects such as tweezers to prevent wire breakage.
3. Do not apply excessive force to products mounted on boards to prevent core breakage.

#### < Transportations >

Do not apply excessive vibration or mechanical shock to products.

#### < Resin Coating >

When coating products with resin, the relatively high resin curing stress may change inductance values.

For exterior coating, select resin carefully so that electrical and mechanical performance of the product is not affected.

## Notice

### ■ Notice (Measuring Method)

#### Measuring Method of Inductance/Q

1. Residual elements and stray elements of test fixture can be described by F-parameter shown in following.

2. The impedance of chip coil  $Z_x$  and measured value  $Z_m$  can be described by input/output current/voltage.

$$Z_m = \frac{V_1}{I_1}, \quad Z_x = \frac{V_2}{I_2}$$

3. Thus, the relation between  $Z_x$  and  $Z_m$  is following;

$$Z_x = \alpha \frac{Z_m - \beta}{1 - Z_m \Gamma} \quad \text{where, } \alpha = D / A = 1$$

$$\beta = B / D = Z_{sm} - (1 - Y_{om} Z_{sm}) Z_{ss}$$

$$\Gamma = C / A = Y_{om}$$

$Z_{sm}$  : measured impedance of short chip  
 $Z_{ss}$  : residual impedance of short chip\*  
 $Y_{om}$  : measured admittance when opening the fixture

#### \*Residual impedance of short chip

Residual impedance	Series
0nH	LQG15HS
0.430nH	LQP03T
0.556nH	LQG15HN, LQW15A, LQP15T/M
0.771nH	LQG18H, LQP18M, LQW18A

3.  $L_x$  and  $Q_x$  shall be calculated with the following equation.

$$L_x = \frac{\text{Im}(Z_x)}{2\pi f}, \quad Q_x = \frac{\text{Im}(Z_x)}{\text{Re}(Z_x)}$$

$L_x$  : Inductance of chip coil  
 $Q_x$  : Q of chip coil  
 $f$  : Measuring frequency

# Murata Chip S-Parameter & Impedance Library

## Download Service

The program enables you to calculate, view and print graphs of impedance and S parameter of chip capacitors or chip inductors.

S parameter data in Touchstone format can also be copied.

Main Window

- Easy operation due to using Windows interface.
- Fast calculation of data and graph for S parameter and impedance of chip capacitors or chip inductors.
- S parameter is saved in your personal computer and utilized for circuit simulation.

This software uses the Global Part Numbers that have been adopted since June 2001. The Previous Part Numbers can be used by selecting "view" menu. Please check carefully when referring to the contents.

This simulator can be downloaded from Murata web site.
