**GENERAL DESCRIPTION**

The Samsung KMM5364005C is a 4Mx36bits Dynamic RAM high density memory module. The Samsung KMM5364005C consists of two CMOS 4Mx16bits and one CMOS Quad CAS 4Mx4bits DRAMs in TSOP packages mounted on a 72-pin glass-epoxy substrate. A 0.1 or 0.22uF decoupling capacitor is mounted on the printed circuit board for each DRAM. The KMM5364005C is a Single In-line Memory Module with edge connections and is intended for mounting into 72 pin edge connector sockets.

## NOTES

- An initial pause of 200us is required after power-up followed by any 8 RAS-only or CAS-before-RAS refresh cycles before proper device operation is achieved.
- Input voltage levels are V<sub>ih</sub>/V<sub>il</sub>. V<sub>IH</sub>(min) and V<sub>IL</sub>(max) are reference levels for measuring timing of input signals. Transition times are measured between V<sub>IH</sub>(min) and V<sub>IL</sub>(max) and are assumed to be 5ns for all inputs.
- Measured with a load equivalent to 2 TTL loads and 100pF.
- Operation within the t<sub>RCD</sub>(max) limit insures that t<sub>RAC</sub>(max) can be met. t<sub>RCD</sub>(max) is specified as a reference point only. If t<sub>RCD</sub> is greater than the specified t<sub>RCD</sub>(max) limit, then access time is controlled exclusively by t<sub>CAC</sub>.
- Assumes that t<sub>RCD</sub> ≥ t<sub>RCD</sub>(max).
- This parameter defines the time at which the output achieves the open circuit and is not referenced for V<sub>OH</sub> or V<sub>OL</sub>.
- t<sub>WCS</sub> is non-restrictive operating parameter. It is included in the data sheet as electrical characteristics only. If t<sub>WCS</sub> ≥ t<sub>WCS</sub>(min), the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle.
- Either t<sub>TRCH</sub> or t<sub>TRRH</sub> must be satisfied for a read cycle.
- These parameters are referenced to the CAS leading edge in early write cycles.
- Operation within the t<sub>TRAD</sub>(max) limit insures that t<sub>TRAC</sub>(max) can be met. t<sub>TRAD</sub>(max) is specified as reference point only. If t<sub>TRAD</sub> is greater than the specified t<sub>TRAD</sub>(max) limit access time is controlled by t<sub>AA</sub>.
- t<sub>ASC</sub> ≥ 6ns, Assume t<sub>T</sub> = 2.0ns.
- If RAS goes high before CAS high going, the open circuit condition of the output is achieved by CAS high going. If CAS goes high before RAS high going, the open circuit condition of the output is achieved by RAS going.
