

Low Noise, Low Power, SPI[®] Bus, 128 Taps

The ISL22446 integrates four digitally controlled potentiometers (DCP) and non-volatile memory on a monolithic CMOS integrated circuit.

The digitally controlled potentiometers are implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the SPI serial interface. Each potentiometer has an associated volatile Wiper Register (WR) and a non-volatile Initial Value Register (IVR) that can be directly written to and read by the user. The contents of the WR controls the position of the wiper. At power-up the device recalls the contents of the DCP's IVR to the corresponding WR.

The DCPs can be used as three-terminal potentiometers or as two-terminal variable resistors in a wide variety of applications including control, parameter adjustments, and signal processing.

Pinout

ISL22446
(20 LD TSSOP)
TOP VIEW

Features

- Four potentiometers in one package
- 128 resistor taps
- SPI serial interface
- Non-volatile storage of wiper position
- Wiper resistance: 70Ω typical @ 3.3V
- Shutdown mode
- Shutdown current 5μA max
- Power supply: 2.7V to 5.5V
- 50kΩ or 10kΩ total resistance
- High reliability
 - Endurance: 1,000,000 data changes per bit per register
 - Register data retention: 50 years @ T ≤55°C
- 20 Lead TSSOP
- Pb-free plus anneal product (RoHS compliant)

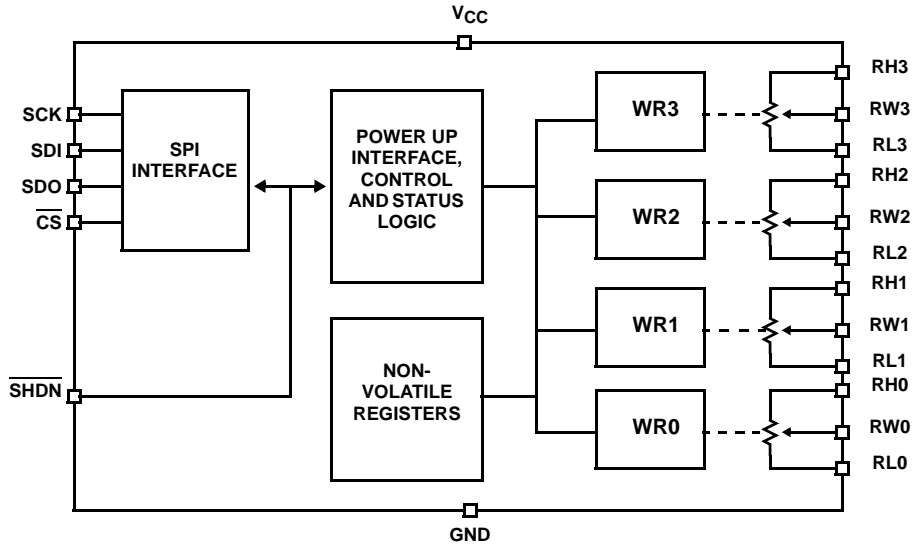

Ordering Information

PART NUMBER	PART MARKING	RESISTANCE OPTION (kΩ)	TEMP. RANGE (°C)	PACKAGE	PKG. DWG. #
ISL22446UFV20Z (Notes 1, 2)	22446 UFVZ	50	-40 to +125	20 Ld TSSOP (Pb-free)	M20.173
ISL22446WV20Z (Notes 1, 2)	22446 WVZ	10	-40 to +125	20 Ld TSSOP (Pb-free)	M20.173

NOTES:

1. Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
2. Add "-TK" suffix for 1,000 Tape and Reel option

Absolute Maximum Ratings

Storage Temperature	-65°C to +150°C
Voltage at any Digital Interface Pin with Respect to GND	-0.3V to V _{CC} +0.3
V _{CC}	-0.3V to +6V
Voltage at any DCP pin with Respect to GND	-0.3V to V _{CC}
Lead Temperature (Soldering, 10s)	300°C
I _W (10s)	±6mA
Latchup (Note 4)	Class II, Level B @ +125°C
ESD (HBM)	2.5kV
(CDM)	1k

Thermal Information

Thermal Resistance (Typical, Note 3)	θ _{JA} (°C/W)
20 Lead TSSOP	90

Recommended Operating Conditions

Temperature Range (Extended Industrial)	-40°C to +125°C
Power Rating	5mW
Maximum Junction Temperature	150°C
V _{CC}	2.7V to 5.5V
Wiper Current	±3.0mA

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

- θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
- Jedec Class II pulse conditions and failure criterion used. Level B exceptions are: using a max positive pulse of 6.5V on the SHDN pin, and using a max negative pulse of -0.8V for all pins.

Analog Specifications Over recommended operating conditions unless otherwise stated.

NOTES:

- Typical values are for $T_A = +25^\circ\text{C}$ and 3.3V supply voltage.
- LSB: $[V(RW)_{127} - V(RW)_0]/127$. $V(RW)_{127}$ and $V(RW)_0$ are $V(RW)$ for the DCP register set to 7F hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
- ZS error = $V(RW)_0/\text{LSB}$.
- FS error = $[V(RW)_{127} - V_{CC}]/\text{LSB}$.
- DNL = $[V(RW)_i - V(RW)_{i-1}]/\text{LSB} - 1$, for $i = 1$ to 127. i is the DCP register setting.
- INL = $[V(RW)_i - i \cdot \text{LSB} - V(RW)]/\text{LSB}$ for $i = 1$ to 127
- $V_{MATCH} = [V(RW_x)_i - V(RW_y)_i]/\text{LSB}$, for $i = 1$ to 127, $x = 0$ to 3 and $y = 0$ to 3.
- $TC_V = \frac{\text{Max}(V(RW)_i) - \text{Min}(V(RW)_i)}{[\text{Max}(V(RW)_i) + \text{Min}(V(RW)_i)]/2} \times \frac{10^6}{165^\circ\text{C}}$ for $i = 16$ to 112 decimal, $T = -40^\circ\text{C}$ to $+125^\circ\text{C}$. $\text{Max}()$ is the maximum value of the wiper voltage and $\text{Min}()$ is the minimum value of the wiper voltage over the temperature range.
- $MI = |RW_{127} - RW_0|/127$. MI is a minimum increment. RW_{127} and RW_0 are the measured resistances for the DCP register set to 7F hex and 00 hex respectively.

14. $R_{offset} = RW_0/MI$, when measuring between RW and RL.
 $R_{offset} = RW_{127}/MI$, when measuring between RW and RH.
15. $RDNL = (RW_i - RW_{i-1})/MI - 1$, for $i = 16$ to 127.
16. $RINL = [RW_i - (MI \cdot i) - RW_0]/MI$, for $i = 16$ to 127.
17. $R_{MATCH} = (RW_{i,x} - RW_{i,y})/MI$, for $i = 1$ to 127, $x = 0$ to 3 and $y = 0$ to 3.
18. $TC_R = \frac{[Max(Ri) - Min(Ri)]}{[Max(Ri) + Min(Ri)]/2} \times \frac{10^6}{165^\circ C}$ for $i = 16$ to 112, $T = -40^\circ C$ to $+125^\circ C$. $Max()$ is the maximum value of the resistance and $Min()$ is the minimum value of the resistance over the temperature range.
19. t_{WC} is the time from the end of a Write sequence of SPI serial interface, to the end of the self-timed internal non-volatile write cycle.
20. R_{pu} is specified for the highest data rate transfer for the device. Higher value pullup can be used at lower data rates.
21. This parameter is not 100% tested.

Pin Description

Potentiometers Pins

RHi and RLi (i = 0, 1, 2, 3)

The high (RHi) and low (RLi) terminals of the ISL22446 are equivalent to the fixed terminals of a mechanical potentiometer. RHi and RLi are referenced to the relative position of the wiper and not the voltage potential on the terminals. With WRi set to 127 decimal, the wiper will be closest to RHi, and with the WRi set to 0, the wiper is closest to RLi.

RWi (i = 0, 1, 2, 3)

RWi is the wiper terminal and is equivalent to the movable terminal of a mechanical potentiometer. The position of the wiper within the array is determined by the WRi register.

SHDN

The SHDN pin forces the resistor to end-to-end open circuit condition on RHi and shorts RWi to RLi. When SHDN is returned to logic high, the previous latch settings put RWi at the same resistance setting prior to shutdown. This pin is logically OR'd with SHDN bit in ACR register. SPI interface is still available in shutdown mode and all registers are accessible. This pin must remain HIGH for normal operation.

FIGURE 15. DCP CONNECTION IN SHUTDOWN MODE

Bus Interface Pins

Serial Clock (SCK)

This is the serial clock input of the SPI serial interface.

Serial Data Output (SDO)

The SDO is an open drain serial data output pin. During a read cycle, the data bits are shifted out at the falling edge of the serial clock SCK, while the CS input is low.

SDO requires an external pull-up resistor for proper operation.

Serial Data Input (SDI)

The SDI is the serial data input pin for the SPI interface. It receives device address, operation code, wiper address and data from the SPI external host device. The data bits are shifted in at the rising edge of the serial clock SCK, while the CS input is low.

Chip Select (CS)

CS LOW enables the ISL22446, placing it in the active power mode. A HIGH to LOW transition on CS is required prior to the start of any operation after power up. When CS is HIGH, the ISL22446 is deselected and the SDO pin is at high impedance, and (unless an internal write cycle is underway) the device will be in the standby state.

Principles of Operation

The ISL22446 is an integrated circuit incorporating four DCPs with its associated registers, non-volatile memory and the SPI serial interface providing direct communication between host and potentiometers and memory. The resistor array is comprised of individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the potential at that point to the wiper.

The electronic switches on the device operate in a “make before break” mode when the wiper changes tap positions.

When the device is powered down, the last value stored in IVR_i will be maintained in the non-volatile memory. When power is restored, the contents of the IVR_i is recalled and loaded into the corresponding WR_i to set the wiper to the initial value.

DCP Description

Each DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of each DCP are equivalent to the fixed terminals of a mechanical potentiometer (RH and RL pins). The RW pin of each DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by volatile Wiper Register (WR). Each DCP has its own WR. When the WR of a DCP contains all zeroes (WR[6:0]= 00h), its wiper terminal (RW) is closest to its “Low” terminal (RL). When the WR register of a DCP contains all ones (WR[6:0]= 7Fh), its wiper terminal (RW) is closest to its “High” terminal (RH). As the value of the WR increases from all zeroes (0) to all ones (127 decimal), the wiper moves monotonically from the position closest to RL to the closest to RH. At the same time, the resistance between RW and RL increases monotonically, while the resistance between RH and RW decreases monotonically.

While the ISL22446 is being powered up, all four WRs are reset to 40h (64 decimal), which locates RW roughly at the center between RL and RH. After the power supply voltage becomes large enough for reliable non-volatile memory reading, all WRs will be reload with the value stored in corresponding non-volatile Initial Value Registers (IVRs).

The WRs can be read or written to directly using the SPI serial interface as described in the following sections. The SPI interface register address bits have to be set to 0000b, 0001b, 0010b or 0011b to access the WR of DCP0, DCP1, DCP2 or DCP3 respectively. The WR_i and IVR_i can be read or written to directly using the SPI serial interface as described in the following sections.

Memory Description

The ISL22446 contains seven non-volatile and five volatile 8-bit registers. The memory map of ISL22446 is on Table 1. The four non-volatile registers (IVR_i) at address 0, 1, 2 and 3, contain initial wiper value and volatile registers (WR_i) contain current wiper position. In addition, three non-volatile General Purpose registers from address 4 to address 6 are available.

TABLE 1. MEMORY MAP

ADDRESS	NON-VOLATILE	VOLATILE
8	—	ACR
7	Reserved	

TABLE 1. MEMORY MAP

ADDRESS	NON-VOLATILE	VOLATILE
6	General Purpose	Not Available
5	General Purpose	Not Available
4	General Purpose	Not Available
3	IVR3	WR3
2	IVR2	WR2
1	IVR1	WR1
0	IVR0	WR0

The non-volatile IVR_i and volatile WR_i registers are accessible with the same address.

The Access Control Register (ACR) contains information and control bits described below in Table 2.

The VOL bit (ACR[7]) determines whether the access is to wiper registers WR or initial value registers IVR.

TABLE 2. ACCESS CONTROL REGISTER (ACR)

BIT #	7	6	5	4	3	2	1	0
Bit Name	VOL	SHDN	WIP	0	0	0	0	0

If VOL bit is 0, the non-volatile IVR register is accessible. If VOL bit is 1, only the volatile WR is accessible. Note, value is written to IVR register also is written to the WR. The default value of this bit is 0.

The SHDN bit (ACR[6]) disables or enables Shutdown mode. This bit is logically OR'd with $\overline{\text{SHDN}}$ pin. When this bit is 0, DCP is in Shutdown mode. Default value of SHDN bit is 1.

The WIP bit (ACR[5]) is read only bit. It indicates that non-volatile write operation is in progress. The WIP bit can be read repeatedly after a non-volatile write to determine if the write has been completed. It is impossible to write to the IVR_i, WR_i or ACR while WIP bit is 1.

SPI Serial Interface

The ISL22446 supports an SPI serial protocol, mode 0. The device is accessed via the SDI input and SDO output with data clocked in on the rising edge of SCK, and clocked out on the falling edge of SCK. $\overline{\text{CS}}$ must be LOW during communication with the ISL22446. SCK and $\overline{\text{CS}}$ lines are controlled by the host or master. The ISL22446 operates only as a slave device.

All communication over the SPI interface is conducted by sending the MSB of each byte of data first.

Protocol Conventions

The first byte sent to the ISL22446 from the SPI host is the Identification Byte. A valid Identification Byte contains 0101 as the four MSBs, with the following four bits set to 0.

TABLE 3. IDENTIFICATION BYTE FORMAT

0	1	0	1	0	0	0	0
(MSB)				(LSB)			

The next byte sent to the ISL22446 contains the instruction and register pointer information. The four MSBs are the instruction and four LSBs are register address (see Table 4).

TABLE 4. IDENTIFICATION BYTE FORMAT

7	6	5	4	3	2	1	0
I3	I2	I1	I0	R3	R2	R1	R0

There are only two valid instruction sets:

1011(binary) - is a Read operation

1100(binary) - is a Write operation

Write Operation

A Write operation to the ISL22446 is a three-byte operation. It requires first, the \overline{CS} transition from HIGH to LOW, then a valid Identification Byte, then a valid instruction byte following by Data Byte is sent to SDI pin. The host terminates the write operation by pulling the \overline{CS} pin from LOW to HIGH. For a write to addresses 0000b to 0011b, the MSB at address 8 (ACR[7]) determines if the Data Byte is to be written to volatile or both volatile and non-volatile registers. Refer to "Memory Description" and Figure 16.

Device can receive more than one byte of data by auto incrementing the address after each received byte. Note

after reaching the address 0110b, the internal pointer "rolls over" to address 0000b.

The internal non-volatile write cycle starts after rising edge of \overline{CS} and takes up to 20ms. Thus, non-volatile registers must be written individually.

Read Operation

A read operation to the ISL22446 is a three-byte operation. It requires first, the \overline{CS} transition from HIGH to LOW, then a valid Identification Byte, then a valid instruction byte following by "dummy" Data Byte is sent to SDI pin. The SPI host reads the data from SDO pin on falling edge of \overline{CS} . The host terminates the read operation by pulling the \overline{CS} pin from LOW to HIGH (see Figure 17).

The ISL22446 will provide the Data Bytes to the SDO pin as long as SCK is provided by the host from the registers indicated by an internal pointer. This pointer initial value is determined by the register address in the Read operation instruction, and increments by one during transmission of each Data Byte. After reaching the memory location 0110b, the pointer "rolls over" to 0000b, and the device continues to output the data for each received SCK clock.

In order to read back the non-volatile IVR, it is recommended that the application reads the ACR first to verify the WIP bit is 0. If the WIP bit (ACR[5]) is not 0, the host should repeat its reading sequence again.

NOTES:

- These package dimensions are within allowable dimensions of JEDEC MO-153-AC, Issue E.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
- Dimension "E1" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.15mm (0.006 inch) per side.
- The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
- "L" is the length of terminal for soldering to a substrate.
- "N" is the number of terminal positions.
- Terminal numbers are shown for reference only.
- Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08mm (0.003 inch) total in excess of "b" dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07mm (0.0027 inch).
- Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact. (Angles in degrees)

Rev. 1 6/98

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems. Intersil Corporation's quality certifications can be viewed at www.intersil.com/design/quality

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable.
