

CMI-8738/PCI-SX C3DX PCI-Based HRTF 3D Extension Positional Audio Chip

Features

- ◆ HRTF-based 3D positional audio, supporting DirectSound™ 3D and A3D™ interface
- Supports rear side speakers, C3DX positional audio in 4 CH speaker mode
- Legacy audio SBPro™ compatible
- ◆ DLS-based wavetable music synthesizer, supports DirectMusic™
- Built-in 32ohm Earphone buffer
- Drivers support EAX™, Karaoke Echo, Key Surround sound
- ♦ MPU-401 port
- Dual game port
- ♦ 16-bit full duplex CODEC
- 4 CH 16-bit DAC
- ♦ 32-bit PCI bus master
- ♦ External E²PROM interface
- ♦ Single chip design, +5V, 128 pins QFP

With high speed PCI V2.1 bus controller and legacy audio SB16® DSPemulator,CMI8738 is designed for PC add-in cards and all-in-one motherboards. No external CODEC is needed in CMI8738: CMI-8738 supports the legacy audio − SB16[™], FM emulator/DLS wavetable music synthesis, and HRTF 3D positional audio functions.

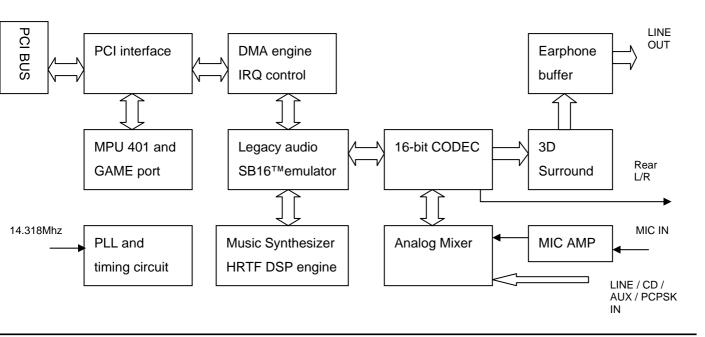

Being compatible with A3D™ and DirectSound™ 3D, CMI8738 meets PC99® requirements

CMI8738 uses HRTF 3D extension technology to enhance traditional HRTF 3D positional audio by substituting two-speaker system by four- speaker one (it supports additional 2CH 16-bit DAC to provide rear side audio). It greatly improves HRTF 3D positional audio quality and successfully removes the sweet spot limitations: users can enjoy genuine 3D audio gaming effects, and don't have to worry about the environmental confinement any more.

Being outstanding for its full audio functions, competitive price, and power management, CMI-8738 is the best choice for people seeking for optimum use of the PC applications.

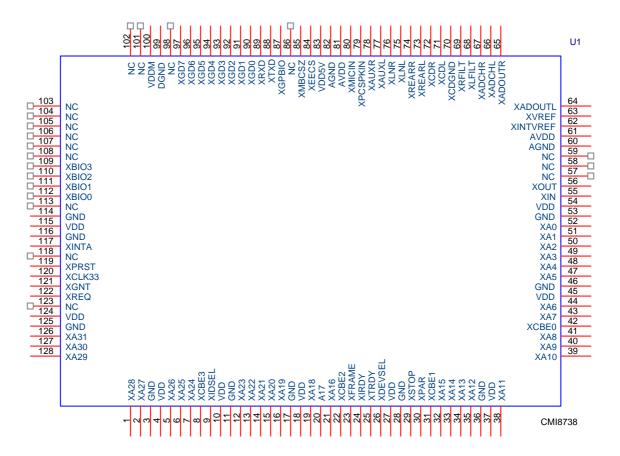

C-Media licensed HRTF 3D library from Central Research Lab (CRL®), U.K, who provides one of the world's best HRTF libraries

CMI-8738/PCI Block Diagram

PINOUT

CMI8738-037-SX AUDIO CHIP QFP 128 PINS

DIGITAL PIN DESCRIPTION

Name	Number	PIN	Definition
WASA WAS		Туре	
XA31-XA0	126-128,1-2,5-7,12-16,19-21,32 -35,38-41,43-44,47-52	1/0	PCI bus address and data lines
XINTA	117	0	Interrupt request, active-low.
XPRST	119		Reset
XCLK33	120	I	PCI bus clock.
XGNT	121	I	Bus master grant, active-low.
XREQ	122	0	Bus master request, tri-state
			output, active-low.
XIDSEL	9	1	ID select, active-high.
XFRAME	23	I/O	Cycle frame, active-low.
XIRDY	24	1/0	Initiator ready, active-low. The bus
,		,, 0	master device is ready to transmit
			or receive data
XTRDY	25	1/0	Target ready, active-low. The target
			device is ready to transmit or
			receive data
XDEVSEL	26	I/O	Device select, active-low. The
			target device has decoded the
			address of the current transaction
			as its own chip select range.
XSTOP	29	I/O	Stop transaction, active-low. The
			target device request to the master
			to stop the current transaction.
XPAR	30	I/O	Parity. The pin indicates even parity
			across XA31-XA9 and XCBE3-0 for
			both address and data phases.
XCBE3,2,1,0	8,22,31,42	I/O	Multiplexed command/byte enable.
			These pins indicate cycle type
			during the address phase of a
			transaction.
VDD	4,10,18,27,37,45,54,115,124	+5V	Digital and PCI I/O power pin
GND	3,11,17,28,36,46,53,114,116,12 5	GND	Digital and PCI I/O ground
XIN	55	I	14.318Mhz crystal, or external clock
			input
XOUT	56	0	14.318Mhz crystal
XGD7-XGD4		I	Game port switch input pin.
			Switch D to switch A
XGD3-XGD0	93-90	I/O	Game port resistor input pin.
		. =	RC3 to RC0
XTXD	88	0	MIDI transmit data
XRXD	89	I	MIDI receive data
XBIO3-XBIO	109-112	I/O	General purpose I/O
0		. =	
VDD5V	83	+5V	Digital and PCI I/O power pin
VDDM	100	+5V	Digital and PCI I/O power pin
DGND	99	GND	Digital and PCI I/O ground
XEECS	84	0	EEPROM chip select
VELOG	דטן	<u> </u>	LEI VOIN GIIID SEIER

ANALOG PIN DESCRIPTION

AVDD	61,81	+5V	Analog power
AGND	60,82	GND	Analog ground
XADOUTL-R		AO1	Line out
XADCHL-R	66,67	AI/O	ADC filter
XLFILT	68	AI/O	Left channel DAC filter
XRFILT	69	AI/O	Right channel DAC filter
XVREF	63	ΑI	Reference Voltage (no use, left it
			floating)
XINTVREF	62	Al	Reference Voltage
XCDL-R	71,72,70	ΑI	CD audio differential input
XCDGND			
XLNL-R	75,76	Al	Line in or Rear speaker out
XAUXL-R	77,78	ΑI	Aux. Line in
XPCSPKIN	79	ΑI	PC beep signal
XMICIN	80	Al	Microphone in
XREARL-R	73,74	AI/O	Rear speaker out
XGPBIO	87	0	General purpose I/O pin
XMBCSZ	85	I	Audio chip select (low:enable)
NC	57-59,86,98,101-108,113,118,1 23	-	Reserved

ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings

Ratings	Symbol	Value	Units
Digital power voltage	VDD	VDD±5%	٧
Analog power voltage	AVDD	AVDD±5%	٧

		11 Base address: 300h
28		Reserved
27-26	VSBSEL[1:0]	The Base Address Select for SB16 access.
		00 Base address: 220h
		01 Base address: 240h
		10 Base address: 260h
		11 Base address: 280h
25-24	FMSEL[1:0]	The Base Address Select for FM access.
		00 Base address: 388h
		01 Base address : 3C8h
		10 Base address : 3E0h
		11 Base address : 3E8h
23-21	Reserved	
20	SetRetry	Mode of wait state . 0:legacy I/O wait (default) 1:legacy I/O BUS
retry		
19	C_EEACCESS	Direct programming EEPROM interface Registers.
18	C_EECS	
17	C_EEDI46	
16	C_EECK46	
15-0	Reserved	

Micellaneous Control Register

Address 18H

Bit(s)	R/W	Name	Description
31		PWD	Power Down Mode enabled
30		RESET	Reset Bus Master/DSP Engine.
29-28		SFIL[1:0]	Four level of filter control at the front end DAC
27		TX/VX	Which motherboard to work with
			0 VX chip sets.
			1 TX chip sets.
26		N4SPK3D	Hardware copy front channel to rear channel
25-24		Reserved	
23		ENDBDAC	Default low, High will enable Double DAC structure.
22		XCHGDAC	Default low,
			0 CH0 > Front SPKR, CH1 > Back SPKR.
			1 CH0 > Back SPKR, CH1 > Front SPKR.
21-20		Reserved	
19		FM_EN	Legacy FM enabled.

18-17	Reserved		
16	VIDWPDSB	Sub ID write protect disabled. (default 0)	
15	Reserved		
14	MASK_EN	Activate channel mask on Legacy DMA.	
		0 Disabled	
		1 Enabled	
13	VIDWPDSB	Write Protect of HSP Configuration Sub ID.	
		0 Protect.	
		1 No protect.	
12	SFILENB	Let software contrl filter stepping at the front end DAC.	
11-5	Reserved		
4	MIDSMP	Enable 1/2 interpolation at the Front end DAC	
3-2	UPDDMA[1:0]	For every the number of samples to notify updating TDMA position.	
		00 Every 2048 samples	
		01 Every 1024 samples	
		10 Every 512 samples.	
		11 Every 256 samples.	
1-0	TWAIT[1:0]	For controling the length of legacy BUS cycle.	
		00 3 PCICLK.	
		01 18 PCICLK.	
		10 24 PCICLK	
		11 32 PCICLK	
* Notice	REQ_SQ[2:0]	States of BusRequest Engine.	
	MM_DATA	Bus Master is using Bus.	
	MIDLE	Bus Master is not using Bus.	
	REQA/REQB	Channel 0/1 BusMaster Request.	
	GNTA/GNTB	Channel 0/1 BusMaster Grant.	
	ADRQ/BDRQ	Channel 0/1 DMA Request.	
	ADACK/BDACK	Channel 0/1 DMA Acknoledge.	
	AIRQ/BIRQ	Channel 0/1 Interrupt.	
	CX/BX	Channel 0/1 Busy.	

T - DMA Position

Address 1CH

Bit(s)	R/W	Name	Description
31-16	R	TDMACN T	Current Byte/Word Count of DMA channel.
15-0	R	TDMAADR	Current Address of DMA channel.

Mixer Control / Device Configure Register (can be accessed only by BYTE instruction)

Address 20H

Bit(s)	R/W	Name	Description
7-0	W	SBVR[7:0]	Programmable SB16 version No.
	R	DEV[7:0]	Hardwire device version No.

Address 21H

Bit(s)	R/W	Name	Description
7-3		Reserved	
2		X_ADPCM	SB16 ADPCM enable, default disabled.
1		PROINV	SBPro Left/Right channel switching.
0		X_SB16	Indicate device active as SB16 compatible, default SB16

Address 22H

Bit(s)	R/W	Name	Description
7-0		IDXdata	Mapping SB compatible mixer INDEX register data port(A2x5h)

Address 23H

Bit(s)	R/W	Name	Description
7-0		IDXaddr	Mapping SB compatible mixer INDEX register address port(A2x4h)

Address 24H

Bit(s)	R/W	Name	Description
7		Fmmute	Mute FM
6		Wsmute	Mute Wave stream
5		SPK4	select four speaker mode(emulate Line in to Line out)
4		Rear2front	exchange rear and front channels's speaker out
3		Waveinl	Digital Wave recording Left channel
2		Waveinr	Digital Wave recording Right channel
1-0		Reserved	

Address 25H

Bit(s)	R/W	Name	Description
7		RAUXREN	Recording source select R-Aux
6		RAUXLEN	Recording source select L_Aux
5		VAUXRM	R-AUX mute control
4		VAUXLM	L-AUX mute control

3-1		VADMIC[2:0]	Recording MIC volume control		
0		MICGAINZ	MIC gain control, default high disable		
			A	Address	26 H
Bit(s)	R/W	Name	Description		
7-4		VAUXL[3:0]	L-AUX volume control		
3-0		VAUXR[3:0]	R-AUX volume control		

Address 27H

Bit(s)	R/W	Name	Description
0		DMAUTO	SB16 Low/High DMA Auto detect enabled ,When high.
1		Reserved	
2		XGPBIO	general purpose bi-direction pin, when high output tri-state
(default L	.OW)		
3		Reserved	
4		Reserved	
5		XGPO1	general purpose output pin 1,this pin shared with XSPDIFO pin,
and enab	led when i	ndex reg. F0_bit	0 programmed high.

6-7 Reserved

Mup401 PCI Port

Index address 40-4FH

FM PCI Port

Index address 50-5FH

Extension Index Register (access from SB compatible mixer port)

Index address F0H

Bit(s)	R/W	Name	Description
7-5		VPHONE[2:0]	Phone volume control
4		VPHOM	Phone mute control
3		VSPKM	PC-Speaker mute control, default high unmute
2		RLOOPREN	Recording R-channel enable
1		RLOOPLEN	Recording L-channel enable
0		VADMIC3	Micphone record boost, default low disable, high enable.

Index address F8-FFH

These 8 registers is used to programming M/N conunter by clock generator

Channel 0 Frame Register 1

Address	80⊦
---------	-----

Bit(s)	R/W	Name	Description
31-0	W	BASADDR0	Base address of channel 0.
	R	CURADDR0	Current address of channel 0.

Channel 0 Frame Register 2

Address	84H
Address	04⊓

Bit(s)	R/W	Name	Description
31-16	W	BASCNT0	Base count of samples at Codec.
15-0	W	BASCNT0	Base count of samples at Bus Master.
31-16	R	CURCNT0	Current count of samples at Codec.
15-0	R	CURCNT0	Current count of samples at Bus Master.

Channel 1 Frame Register 1

Address 88H

Bit(s)	R/W	Name	Description
31-0	W	BASADDR1	Base address of channel 0.
	R	CURADDR1	Current address of channel 0.

Channel 1 Frame Register 2

Address 8CH

Bit(s)	R/W	Name	Description
31-16	W	BASCNT1	Base count of samples at Codec.
15-0	W	BASCNT1	Base count of samples at Bus Master.
31-16	R	CURCNT1	Current count of samples at Codec.
15-0	R	CURCNT1	Current count of samples at Bus Master.

1. Stereo

It is only one-dimensional, as sounds come from (left /right) the physical location of speakers.

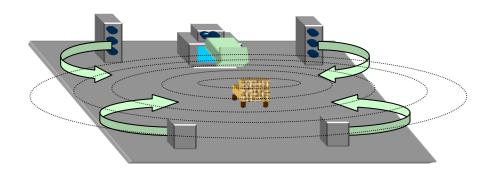

2. Surround (Stereo Expander)

It filters the existing stereo signal to make the sounds fill in the area around the speakers, and in front of the listener. Sound sources appear to come from outside the physical locations of the speakers.

3. Multi-Speaker Surround (Dolby Pro Logic or Digital AC-3)

It uses five speakers instead of two to surround the listener; hence, sound sources come from five directions and create engaging audio experience. This surround sound effect, however, has to be pre-recorded, and it dose not support interactive environment.

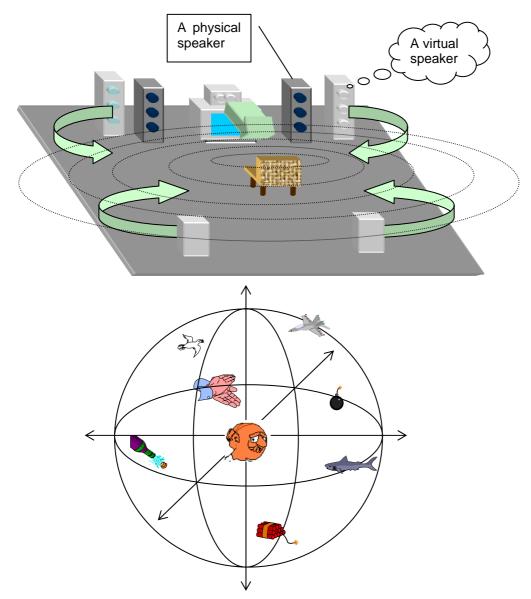

4. HRTF 3D Positional 3D (C-Media 3D) **■**3D

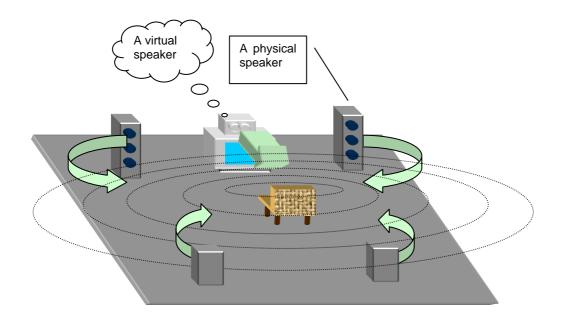

Only this sound processing technology can be called real 3D manifestation, as 3D usually refers to the three dimensions of X, Y and Z. This technology allows people to pin-point the location of sound in the real world (up/down, left/right, front/back)using only two speakers or a pair of headphones. This technology also supports interactive 3D applications to get a real-time placement of sounds via API (application programming interface) such as Microsoft DirectSound3DTM. We can also use this technology to simulate Multi-speaker Surround with two physical speakers to deliver five "virtual" speakers in the air, surrounding the listener and creating home theater sound environment. This is the most economical and the easiest solution to people who would like to get high performance surround sound but don't want to spend money in adding extra speakers.

5. HRTF 3D Extension Positional (C-Media 3DX) **∠**3DX

3D illusion exists because traditional 3D positional audio system assumes the user's position as the sweet spot to design crosstalk-cancellation circuit; therefore, if the user wants to have 3D positional audio effects, he can't move his head or position out of sweet spot. Another 3D illusion fails because half the population are compulsive "head-turners" who will never get 3D audio from two speakers. To remedy this, C-Media utilizes HRTF 3D extension technology (C3DX) to enhance traditional HRTF 3D positional audio by substituting two-speaker system by four-speaker one. Therefore, at least one or two speakers should be placed behind the listener's head to complement the rear-side effect, thus creating compelling realistic sound. This technology greatly improves HRTF 3D positional audio quality, and successfully eliminates the sweet spot limitation. Users can enjoy the real 3D audio gaming effects, and don't have to worry about the environmental confinement any more.

C3D HRTF Positional Audio Technology

C3D technology uses an audio filter called Head Related Transfer Functions (HRTFs), which is licensed from CRL®(Central Research Lab). The basic concept of C3D is: since we can hear sound three dimensionally in the real world using our two ears, it must be possible to regenerate the same sound effect from two loud speakers.

What is HRTF?

HRTF (Head Related Transfer Functions) is a set of audio filters which can vary locations of sound effects (spatial hearing cues) in three-dimension measured from the listener's eardrum.

People can use this technology and special digital signal processing to re-create spatial hearing cues, so as to makes the ears hear a realistic and three-dimensional sounds coming from a pairs of loud speakers or headphones.

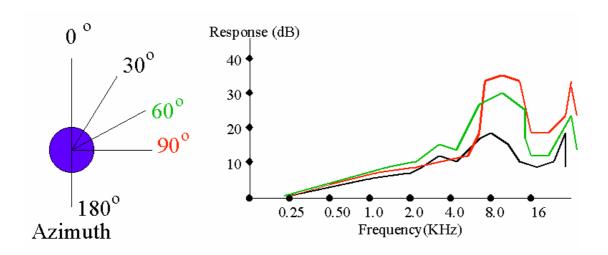

There are several listening cues which allow people to hear sounds three-dimensionally:

(I). Spatial Hearing: Primary 3D-cues

1. IAD

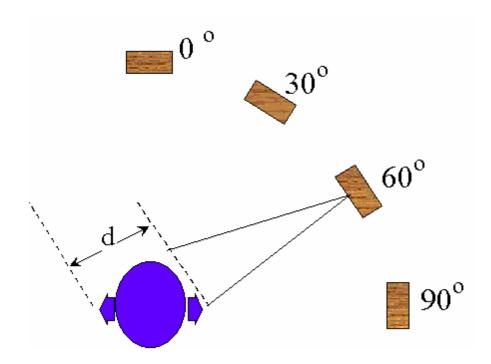

The head shadowing effect creates differences in the amplitudes of the sound signals arriving at each ear from the source. The effects of diffraction are most noticeable in the range between about 700 Hz to 8 KHz, where the A and S functions periodically converge and diverge gently. This Inter-aural Amplitude difference (IAD) is one of the primary 3D sound cues.

2. ITD

In addition to IAD, there is also a time-of-arrival difference between the left and right ears (unless the sound source is in one of the pole positions, such as directly in front, behind, above and below): this is known as the Inter-aural Time Delay (ITD).

3. Pinna Effects

It has been presumed by several researchers that the convolutions of the pinna create the spectral features which constitute the 'height' cues. In practical experiments by Gardner, in which different parts of the pinna were occluded, and then the ability of a number of subjects to identify sound source positions at different heights was tested, it was shown that the different features all contributed by different amounts. For example, if the fossa is excluded, then height localization capability is impaired, but not totally extinguished. It would be reasonable to conclude that it is the combined effect of the pinna convolutions which create the various localization cues, and it is not valid - or logical - to attempt to assign particular spatial capabilities with individual physical features.

(II). Spatial Hearing: Secondary 3D-cues (shoulder & local reflections)

In addition to the 'primary' 3D sound cues (IAD, ITD and pinna effects), there are several additional cues which do contribute to the localization capability; these will be referred to here as 'secondary' cues, and include shoulder/torso reflections, local room reflections, and psychological cues.

Shoulder / Torso reflections

The presence of a torso attached to an artificial head has the effect of increasing the pressure in the vicinity of the ear up to frequencies of around 2 kHz. The effect is greater for frontal sources than lateral ones. In experience, the presence of the torso does not appear to contribute much to spatial accuracy. However, shoulders are located very close to the ears, and their effect is greater, this time, in respect of

HRTF 3D Positional Audio Technology White-Paper lateral sounds. If one listens to an artificial head first without - and then with - shoulder fitments, then it is clear that the shoulders do contribute to spatial effects in certain positions. The shoulders provide a strong reflection from lateral sources, with a short path-length of around 10 cm between direct sound and reflection. The effects are most important for side-positioned sources, especially for "height" effects, where the shoulders tend to mask sources which move below about 30 degree depression.

2. Local, Room Reflections

In simulations, it is clear that the incorporation of first-order simulated room reflections can help in the creation of sound images which have a "solid" nature. However, the effects - if accurately simulated - are relatively slight. Experience has shown that it is primarily the quality of the HRTFs themselves which determine the quality and solidity of the sound image. The further addition of second-order reflections does not help significantly, because in reality, there is a great number of reflections in the average room. A method which does help to recreate the acoustic experience of a room, however, is to use approximate simulations of lateral reverb, using either 2 or 4 laterally placed "virtual" sources at, say, +-70 degrees and 80 degrees azimuth.

- The quality of the sound image relates to the HRTFs used.
- The quality of the room image relates to addition of reflections and reverb.

3. Psychological Cues

There are clearly psychological cues present in everyday life which work together with the audio cues to tell us about the world around us. For example, if you hear the sound of a helicopter flying, you expect it to be up in the air, and not downwards. If a dog is barking nearby, you would expect it to be downwards.

How to listen to C3D sound correctly and properly?

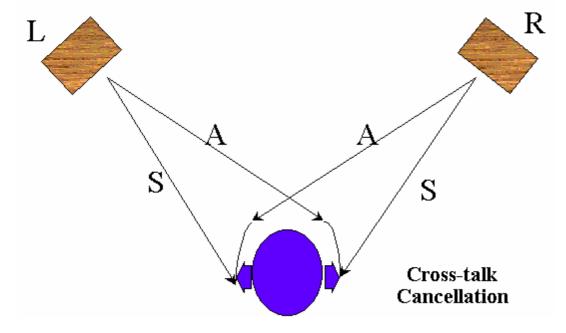

1. Use Headphones to Have Much Better Effect

When you use headphones in listening, there will be less interference such as outside voices or room reflections comparing to using speakers.

HRTF 3D Positional Audio Technology White-Paper

2. Choose Correct Output Devices

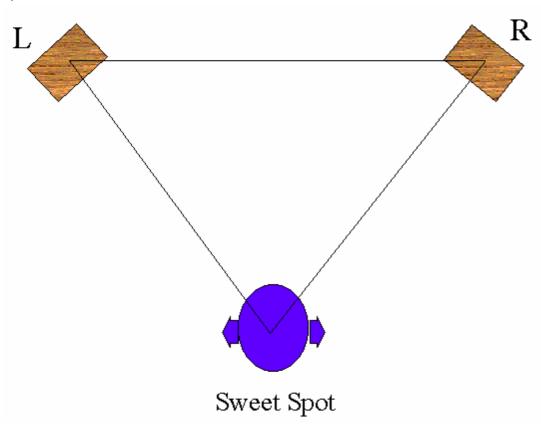

Choose the correct output devices in the options of demo program in accordance with what listening devices you want to listen to. Listening through speakers must be proceeded by crosstalk-cancellation, so if you choose the wrong output devices, there won't be any 3D positional audio effect.

3. Position of Speakers

If you listen from speakers, please do not reverse the left and right speakers, which should be put in equal distance from the listener. That is, the listener, the left, and the right speaker must be in the topmost of a right triangle. The position of the listener is called the "sweet spot". In addition, the height of the listener's ears must be equal to that of the speakers.

4. Turn Surround Sound Functions off

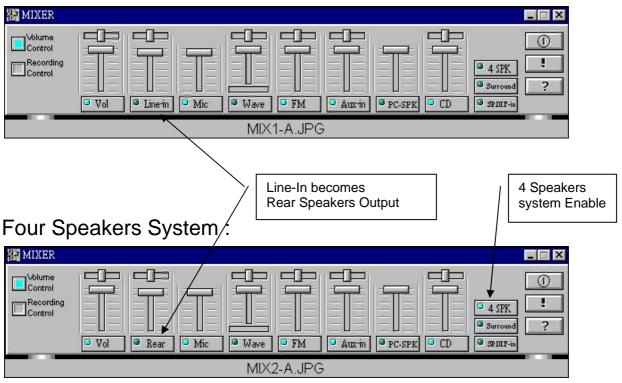

When the surround sound effect is enabled, it will cause confusion with C3D sound, and make positional sound effect invalid.

Audio Rack Panel

Two Speakers System:

CMI8738 PCI Audio Adapter Layout Notes

- 1. The wires of analog circuits(chip pin64-80) must be wider than 12mil.
- 2. The whole PCB grounding should be well-organized(The ground must be placed as much as possible. Also, the ground of both the component and the solder sides should be drilled as much as possible.).
- 3. The grounding under CMI8738 should be well-organized as mentioned above.
- 4. The regulator(78L05) must be placed near the chip as much as possible.
- 5. The chip and the circuits need independent power supply regulators to prevent insufficient currents.
