DESCRIPTION:

The LVC823A 9-bit bus-interface flip-flop is built using advanced dual metal CMOS technology. The LVC823A device is designed specifically for driving highly capacitive or relatively low-impedance loads. The device is particularly suitable for implementing wider buffer registers, I/O ports, bidirectional bus drivers with parity, and working registers.

With the clock-enable ($\overline{CLKEN}$) input low, the nine D-type edge-triggered flip-flops enter data on the low-to-high transitions of the clock. Taking $\overline{CLKEN}$ high disables the clock buffer, latching the outputs. This device has noninverting data (D) inputs. Taking the clear ($\overline{CLR}$) input low causes the nine Q outputs to go low, independently of the clock.

A buffered output-enable ($\overline{OE}$) input can be used to place the nine outputs in either a normal logic state (high or low logic levels) or a high-impedance state. $\overline{OE}$ does not affect internal operations of the latch. Previously stored data can be retained or new data can be entered while the outputs are in the high-impedance state.

The LVC823A has been designed with a ±24mA output driver. This driver is capable of driving a moderate to heavy load while maintaining speed performance.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to Vcc through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Inputs can be driven from either 3.3V or 5V devices. This feature allows the use of this device as a translator in a mixed 3.3V/5V system environment.
