3. Operation

This section describes the basic components, functions and operation of the TMP91CW18A.

Notes and restrictions which apply to the various items described here are outlined in Section 7. Precautions and Restrictions at the end of this databook.

3.1 CPU

The TMP91CW18A incorporates a high-performance 16-bit CPU (the 900/L1 CPU). For a description of this CPU's operation, please refer to the section of this databook which describes the TLCS-900/L1 CPU.

The following sub-sections describe functions peculiar to the CPU used in the TMP91CW18A; these functions are not covered in the section devoted to the TLCS-900/L1 CPU.

3.1.1 Reset

When resetting the TMP91CW18A microcontroller, ensure that the power supply voltage is within the operating voltage range, and that the internal high-frequency oscillator has stabilized. Then hold the RESET input Low for at least 10 system clocks (ten states: 80 μ s at 4 MHz).

When the Reset has been accepted, the CPU performs the following:

- Sets the Program Counter (PC) as follows in accordance with the Reset Vector stored at address FFFF00H to FFFF02H:

PC<0:7>	←	data in location FFFF00H
PC<8:15>	←	data in location FFFF01H
PC<16:23>	←	data in location FFFF02H
- Sets the Stack Pointer (XSP) to 100H.
- Sets bits <IFF0:2> of the Status Register (SR) to 111 (thereby setting the Interrupt Level Mask Register to level 7).
- Sets the <MAX> bit of the Status Register to 1 (MAX mode).

Note: As this product does not support MIN mode, do not write a 0 to the <MAX> bit.

- Clears bits <RFP0:2> of the Status register to 000 (thereby selecting register bank 0).

When the Reset is cleared, the CPU starts executing instructions according to the program counter settings. CPU internal registers not mentioned above do not change when the Reset is cleared.

When the Reset is accepted, the CPU sets internal I/O, ports and other pins as follows.

- Initializes the internal I/O registers.
- Sets the port pins, including the pins that also act as internal I/O, to General-purpose input or Output port mode.
- Sets the ALE pin to High-Z.

Note: By resetting, register in CPU except program counter (PC), status register (SR), and stack Pointer (XSP) and the data in internal RAM are not changed.

Figure 3.1.1 shows the timing of a Reset for the TMP91CW18A.

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.
