+5V RS-232 Transceivers with 0.1 μ F External Capacitors

MAX200-MAX211/MAX213

General Description

The MAX200-MAX211/MAX213 transceivers are designed for RS-232 and V.28 communication interfaces where ± 12 V supplies are not available. On-board charge pumps convert the +5V input to the ± 10 V needed for RS-232 output levels. The MAX201 and MAX209 operate from +5V and +12V, and contain a +12V to -12V charge-pump voltage converter.

The MAX200-MAX211/MAX213 drivers and receivers meet all EIA/TIA-232E and CCITT V.28 specifications at a data rate of 20kbits/sec. The drivers maintain the ± 5 V EIA/TIA-232E output signal levels at data rates in excess of 120kbits/sec when loaded in accordance with the EIA/TIA-232E specification.

The 5 μ W shutdown mode of the MAX200, MAX205, MAX206, and MAX211 conserves energy in battery-powered systems. The MAX213 has an active-low shutdown and an active-high receiver enable control. Two receivers of the MAX213 are active, allowing ring indicator (RI) to be monitored easily using only 75 μ W power.

The MAX211 and MAX213 are available in a 28-pin wide small-outline (SO) package, and a 28-pin shrink small-outline package (SSOP), which occupies only 40% of the area of the SO. The MAX207 is now available in a 24-pin SO package and a 24-pin SSOP. The MAX203 and MAX205 use no external components, and are recommended for applications with limited circuit board space.

Applications

Computers
Laptops, Palmtops, Notebooks
Battery-Powered Equipment
Hand-Held Equipment

Features

Superior to Bipolar:

- ♦ 0.1 μ F to 10 μ F External Capacitors
- ♦ 120kbits/sec Data Rate
- ♦ 2 Receivers Active in Shutdown Mode (MAX213)
- ♦ Small 28-Pin SSOP Package -
Uses 60% Less Space than SOIC
- ♦ Low-Power Shutdown Current: 1 μ A
- ♦ Designed for RS-232 and V.28 Applications
- ♦ Three-State TTL/CMOS Receiver Outputs

Detailed Description

The MAX200–MAX211/MAX213 consist of three sections: charge-pump voltage converters, drivers (transmitters), and receivers. Each section is described in detail below.

+5V to $\pm$ 10V Dual Charge-Pump Voltage Converter

+5V to $\pm$ 10V conversion is performed by two charge-pump voltage converters (Figure 4). The first uses capacitor C1 to double +5V to +10V, storing +10V on the V+ output filter capacitor, C3. The second charge-pump voltage converter uses capacitor C2 to invert +10V to -10V, storing -10V on the V- output filter capacitor, C4.

The MAX201 and MAX209 include only the V+ to V- charge-pump, and are intended for applications that have a VCC = +5V supply and a V+ supply in the +9V to +13.2V range.

In shutdown mode, V+ is internally connected to VCC by a 1k Ω pull-down resistor and V- is internally connected to ground by a 1k Ω pull-up resistor.

RS-232 Drivers

With VCC = 5V, the typical driver-output voltage swing is $\pm$ 8V when loaded with a nominal 5k Ω RS-232 receiver. The output swing is guaranteed to meet the EIA/TIA-232E and V.28 specifications which call for $\pm$ 5V minimum output levels under worst-case conditions. These include a minimum 3k Ω load, VCC = 4.5V, and maximum operating temperature. The open-circuit output voltage swing ranges from (V+ - 0.6V) to V-.

Input thresholds are both CMOS and TTL compatible. The inputs of unused drivers can be left unconnected, since 400k Ω pull-up resistors to VCC are included on-

+5V RS-232 Transceivers with 0.1 μ F External Capacitors

Figure 4. Dual Charge-Pump Diagram

Figure 5. Transmitter Outputs When Exiting Shutdown

chip. Since all drivers invert, the pull-up resistors force the outputs of unused drivers low. The input pull-up resistors typically source 15 μ A; therefore, the driver inputs should be driven high or open circuited to minimize power-supply current in shutdown mode.

When in low-power shutdown mode, the driver outputs are turned off and their leakage current is less than 1 μ A, even if the transmitter output is backdriven between 0V and (VCC + 6V). Below -0.5V, the transmitter output is diode clamped to ground with a 1k Ω series impedance. The transmitter output is also zener clamped to approximately (VCC + 6V), with a 1k Ω series impedance.

RS-232 Receivers

The receivers convert RS-232 signals to CMOS logic output levels. Receiver outputs are inverting, maintaining compatibility with driver outputs. The guaranteed receiver input thresholds of 0.8V and 2.4V are significantly tighter than the ± 3.0 V thresholds required by the EIA/TIA-232E specification. This allows receiver inputs to respond to TTL/CMOS logic levels, and improves noise margin for RS-232 levels.

The MAX200-MAX211/MAX213's guaranteed 0.8V threshold (0.6V in shutdown for the MAX213) ensures that receivers shorted to ground will have a logic 1 output. Also, the 5k Ω input resistance to ground ensures that a receiver with its input left open will also have a logic 1 output.

Receiver inputs have approximately 0.5V hysteresis. This provides clean output transitions, even with slow rise and fall time input signals with moderate amounts of noise and ringing. In shutdown, the MAX213 receivers R4 and R5 have no hysteresis.

Shutdown and Enable Control

In shutdown mode, the MAX200/MAX205/MAX206/MAX211/MAX213 charge pumps are turned off, V+ is pulled down to VCC, V- is pulled to ground, and the transmitter outputs are disabled. This reduces supply current typically to 1 μ A (15 μ A for the MAX213). The time required to exit shutdown is 1ms, as shown in Figure 5.

All receivers except R4 and R5 on the MAX213 are put into a high-impedance state in shutdown mode. The MAX213's R4 and R5 receivers still function in shutdown mode. These two receivers are useful for monitoring external activity while maintaining minimal power consumption.

+5V RS-232 Transceivers with 0.1μF External Capacitors

The enable control is used to put the receiver outputs into a high-impedance state, so that the receivers can be connected directly to a three-state bus. It has no effect on the RS-232 drivers or on the charge pumps.

MAX213 Receiver Operation in Shutdown

During normal operation, the MAX213's receiver propagation delay is typically 1μs. When entering shutdown with receivers active, R4 and R5 are not valid until 80μs

after $\overline{\text{SHDN}}$ is driven low. In shutdown mode, propagation delays increase to 4μs for a high-to-low or a low-to-high transition.

When exiting shutdown, all receiver outputs are invalid until the charge pumps reach nominal values (<2ms when using 0.1μF capacitors).

Table 1a. MAX200 Control Pin Configurations

SHDN	OPERATION STATUS	TRANSMITTERS T1-T5
0	Normal Operation	All Active
1	Shutdown	All High-Z

Table 1b. MAX205/MAX206/MAX211 Control Pin Configurations

SHDN	$\overline{\text{EN}}$	OPERATION STATUS	TRANSMITTERS T1-T5	RECEIVERS R1-R5
0	0	Normal Operation	All Active	All Active
0	1	Normal Operation	All Active	All High-Z
1	0	Shutdown	All High-Z	All High-Z

Table 1c. MAX213 Control Pin Configurations

$\overline{\text{SHDN}}$	EN	OPERATION STATUS	TRANSMITTERS	RECEIVERS	
			T1-T4	R1-R3	R4, R5
0	0	Shutdown	All High-Z	High-Z	High-Z
0	1	Shutdown	All High-Z	High-Z	Active*
1	0	Normal Operation	All Active	High-Z	High-Z
1	1	Normal Operation	All Active	Active	Active

* Active = active with reduced performance.

MAX200-MAX211/MAX213

+5V RS-232 Transceivers with 0.1 μ F External Capacitors

Applications Information

Capacitor Selection

The type of capacitor used is not critical for proper operation. Ceramic capacitors are suggested. To ensure proper RS-232 signal levels over temperature when using 0.1 μ F capacitors, make sure the capacitance value does not degrade excessively as the temperature varies. If in doubt, use capacitors with a larger nominal value. Also observe the capacitors' ESR (effective series resistance) value over temperature, since it will influence the amount of ripple on V+ and V-. To reduce the output impedance at V+ and V-, use larger capacitors (up to 10 μ F). If polarized capacitors are used, obey the polarities shown in Figure 1 and the Pin Configuration diagrams.

Driving Multiple Receivers

Each transmitter is designed to drive a single receiver. Transmitters can be paralleled to drive multiple receivers.

Driver Outputs when Exiting Shutdown

Figure 5 shows two driver outputs exiting shutdown. As they become active, the two driver outputs are shown going to opposite RS-232 levels (one driver input is high, the other is low). Each driver is loaded with 3k Ω in parallel with 2500pF. The driver outputs display no ringing or undesirable transients as they come out of shutdown.

Power-Supply Decoupling

In applications that are sensitive to power-supply noise, decouple VCC to ground with a capacitor of the same value as the charge-pump capacitors.

V+ and V- as Power Supplies

A small amount of power can be drawn from V+ and V-, although this will reduce noise margins.

Power Supplies for MAX201/MAX209

If at power-up, the V+ supply rises after the VCC supply, place a diode (e.g. 1N914) in series with the V+ supply.

Table 2. Summary of EIA/TIA-232E, V.28 Specifications

PARAMETER	CONDITION	EIA/TIA-232E, V.28 SPECIFICATION
Driver Output Voltage 0 Level 1 Level Output Level, Max	3k Ω to 7k Ω load 3k Ω to 7k Ω load No load	+5.0V to +15V -5.0V to -15V $\pm$ 25V
