NC7WB3306

TinyLogic™ UHS 2-Bit Low Power Bus Switch

General Description

The NC7WB3306 is a 2-bit ultra high-speed CMOS FET bus switch with TTL-compatible active LOW control inputs. The low on resistance of the switch allows inputs to be connected to outputs with minimal propagation delay and without generating additional ground bounce noise. The device is organized as a 2-bit switch with independent bus enable $(\overline{\text{OE}})$ controls. When $\overline{\text{OE}}$ is LOW, the switch is ON and Port A is connected to Port B. When $\overline{\text{OE}}$ is HIGH, the switch is OPEN and a high-impedance state exists between the two ports. Control inputs tolerate voltages up to 5.5V independent of VCC.

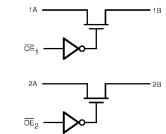

Features

- Space saving US8 surface mount package
- Typical 3Ω switch resistance at 5.0V V_{CC}
- Minimal propagation delay through the switch
- Power down high impedance input/output
- Zero bounce in flow through mode.
- TTL compatible active LOW control inputs
- Control inputs are overvoltage tolerant

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: The input and output negative voltage ratings may be exceeded if the input and output diode current ratings are observed

Note 3: Unused logic inputs must be held HIGH or LOW. They may not

Note 6: This parameter is guaranteed. The bus switch contributes no propagation delay other than the RC delay of the typical On resistance of the switch and the 50 pF load capacitance, when driven by an ideal voltage source (zero output impedance). The specified limit is calculated on this basis.
