

Features

- Dual Mode Low Drop Out Voltage Regulator
- 2.8V Fixed Output Voltage
- 3V to 5.5V Supply Operation
- 160 mA Maximum Load Current in Full Power Mode
- Maximum Current Consumption 61 μ A in Full Power Mode and 12 μ A in Low Power Mode
- Power-down Mode Consumption Less Than 1 μ A
- More Than 70dB (Typical) PSRR at 1 KHz
- 70 μ V_{RMS} Output Noise
- 0.35 μ m CMOS Technology
- Typical Application: Baseband Memory Section Supply in Mobile Terminals

Description

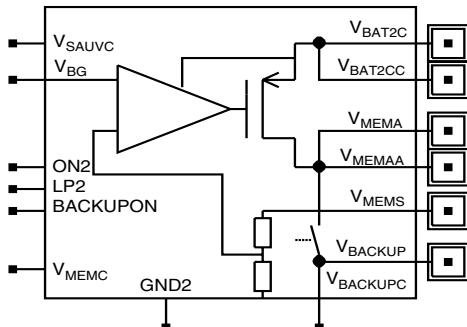

RE024 is a dual mode Low Drop Out (LDO) voltage regulator macrocell with a fixed 2.8V output voltage, rated for loads up to 160 mA in full power mode and 5 mA in low power mode. (Both modes can be selected by the LP2 signal.) It is designed to be integrated with other analog cells, digital logic, microcontrollers, DSP cores and memory blocks into system-on-chip products.

The circuit consists of a PMOS pass device, an error amplifier and a feedback resistive network, sized to achieve the required closed loop gain. These blocks make up the regulating loop. An over-current and short circuit protection circuit has been included to limit the output current delivered by the regulator, thus avoiding destruction in case of a short circuit.

An external reference voltage V_{BG} (bandgap voltage) is necessary for correct functionality. The target reference voltage is 1.231V delivered, for example, by BG019. Double pads on the supply voltage V_{BAT2C}/V_{BAT2CC} and output voltage V_{MEMA}/V_{MEMAA} are used to reduce the total output resistance. Current reference is generated inside the cell through a circuit supplied by a $2.5V \pm 0.1V$ of regulated input voltage on V_{SAUVC} . Remote sense terminal V_{MEMS} provides regulation of the load by connecting it to the output terminal near a critical point to improve performance of the regulator (e.g., connecting it to the package pin by double-bonding, thus avoiding the bonding resistance influence). A ceramic capacitor of 2.2 μ F connected from V_{MEMA}/V_{MEMAA} to ground is needed as external compensation.

A low-leakage current switch has been added to charge a second external capacitor (2.2 μ F - 10 μ F) to V_{MEMA}/V_{MEMAA} . This voltage, called V_{BACKUP} , is used to guarantee 30 minutes of operation time for the internal system clock and calendar in backup mode when the main battery is unplugged.

Absolute Maximum Ratings*

Analog Signals	-0.3V to 6.5V
Digital Signals.....	-0.3V to 5.5V
Output Current.....	Internally limited
Junction Temperature	-20°C to 150°C

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
