

CMOS Circuit for Analog Quartz Clocks with Bipolar Stepping Motor Drive

Description

The H 1344 is a low power 32Khz analog clock integrated circuit designed in HCMOS technology to drive a bipolar stepping motor. A set of capacitors is provided on chip to be connected, in any combination, to the two oscillator terminals, with a maximum total capacitance of 48_pF. Both the motor pulse period and the motor pulse width are mask-programmable. **See page 6 for already available options.**

Applications

- Analog clocks

Features

- 32kHz quartz oscillator
- Integrated capacitors, mask selectable
- Single battery operation
- 0.7 μ A typical current consumption
- Low resistance outputs for bipolar stepping motor
- Mask options for pad designation, motor period and pulse width, alarm frequency, modulation and duty cycle
- Alarm output function compatible with either NPN or PNP-driver transistors
- Alarm input function
- 1024Hz output on AL_{IN} pad for oscillator frequency verification
- Fast test function
- ESD protected terminals

Absolute Maximum Ratings

Parameter	Symbol	Min.	Max.	Units
Supply voltage range	$V_{DD} - V_{SS}$	-0.3	+5	V
Input voltage	V_{IN}	V_{SS}	V_{DD}	V
Storage temperature	T_{STOR}	-55	+125	°C

Table 1

Stresses beyond these listed maximum ratings may cause permanent damage to the device. Exposure to conditions beyond specified operating conditions may affect device reliability or cause malfunction.

Handling Procedures

This device contains circuitry to protect the terminals against damage due to high static voltages or electrical fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this circuit.

Recommended Operating Conditions

Parameter	Symbol	Value	Units
Ambient temperature	T	25	°C
Quartz frequency	F_Q	32768	Hz
Quartz series resistance	R_Q	30	kΩ
Motor coil resistance	R_M	200	Ω
Positive supply	V_{DD}	1.55	V
Negative supply	V_{SS}	0	V

Table 2

Operating Conditions

Parameter	Symbol	Min.	Typ.	Max.	Units
Operating temperature	T_{OPR}	-20	30	+70	°C
Quartz series resistance			50	50	kΩ
Trimmer capacitance	C_{TR}	1.5		30	pF

Functional Description

Oscillator and Frequency Divider

The quartz oscillator consists of an inverter, internal feedback resistance to bias the input and integrated capacitors. The values of the integrated capacitors are selectable by metal mask. The oscillator is designed for 32768Hz.

Motor Drive Output

The circuit contains two push-pull output buffers for driving bipolar stepping motors. Between two pulses, both P-channel transistor of the other buffer are conducting. The outputs are protected against inductive voltage spikes with diodes to both supply pins.

Both the motor pulse period and motor pulse width are programmable by metal mask over a wide range of values (see page 6 for available options).

Alarm Output

The alarm is activated by connecting ALARM_{IN} to V_{SS} and is deactivated by opening the connection. A metal mask option is available to program a continuous activation of the alarm output.

The alarm output driver contains a push-pull output buffer to drive an external sound source by means of an external bipolar transistor. A metal mask option is available to allow the use of NPN or PNP-transistors.

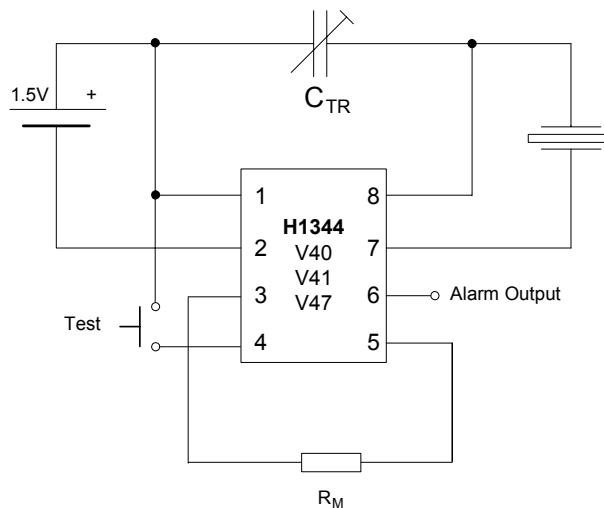

The tone frequency, modulation frequency, modulation frequency and cycle time (ON/OFF time) are metal mask selectable.

Test Mode

The ALARM_{IN} pin fulfills three functions:

- a) For normal operation, the ALARM_{IN} pin is left open. The circuit provides a square wave signal of 1024Hz, which can be used to tune the oscillator.
- b) If the pin is connected to V_{SS}, the alarm signal is provided at pin 6.
- c) If the ALARM_{IN} pin is connected to V_{DD}, all output frequencies are increased by a factor of 64, the alarm modulation of f_{A1} = 8Hz and f_A = 2kHz are suppressed.

Test configuration

Operating range of trimmer

Capacitance: $1.5 \text{ pF} \leq C_{\text{TR}} \leq 30 \text{ pF}$
