

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## PRELIMINARY

Some of contents are subject to change without notice.

### DESCRIPTION

The M5M4V64S20ATP is a 4-bank x 4194304-word x 4-bit Synchronous DRAM, with LVTTTL interface. All inputs and outputs are referenced to the rising edge of CLK. The M5M4V64S20ATP achieves very high speed data rate up to 125MHz, and is suitable for main memory or graphic memory in computer systems.

### FEATURES

- Single 3.3v±0.3v power supply
- Clock frequency 125MHz / 100MHz / 83MHz
- Fully synchronous operation referenced to clock rising edge
- 4 bank operation controlled by BA0, BA1 (Bank Address)
- /CAS latency- 2/3 (programmable)
- Burst length- 1/2/4/8 (programmable)
- Burst type- sequential / interleave (programmable)
- Column access - random
- Auto precharge / All bank precharge controlled by A10
- Auto refresh and Self refresh
- 4096 refresh cycles /64ms
- Column address A0-A9
- LVTTTL Interface
- 400-mil, 54-pin Thin Small Outline Package (TSOP II) with 0.8mm lead pitch

|                  | Max. Frequency | CLK Access Time |
|------------------|----------------|-----------------|
| M5M4V64S20ATP-8  | 125MHz         | 6ns             |
| M5M4V64S20ATP-10 | 100MHz         | 8ns             |
| M5M4V64S20ATP-12 | 83MHz          | 8ns             |

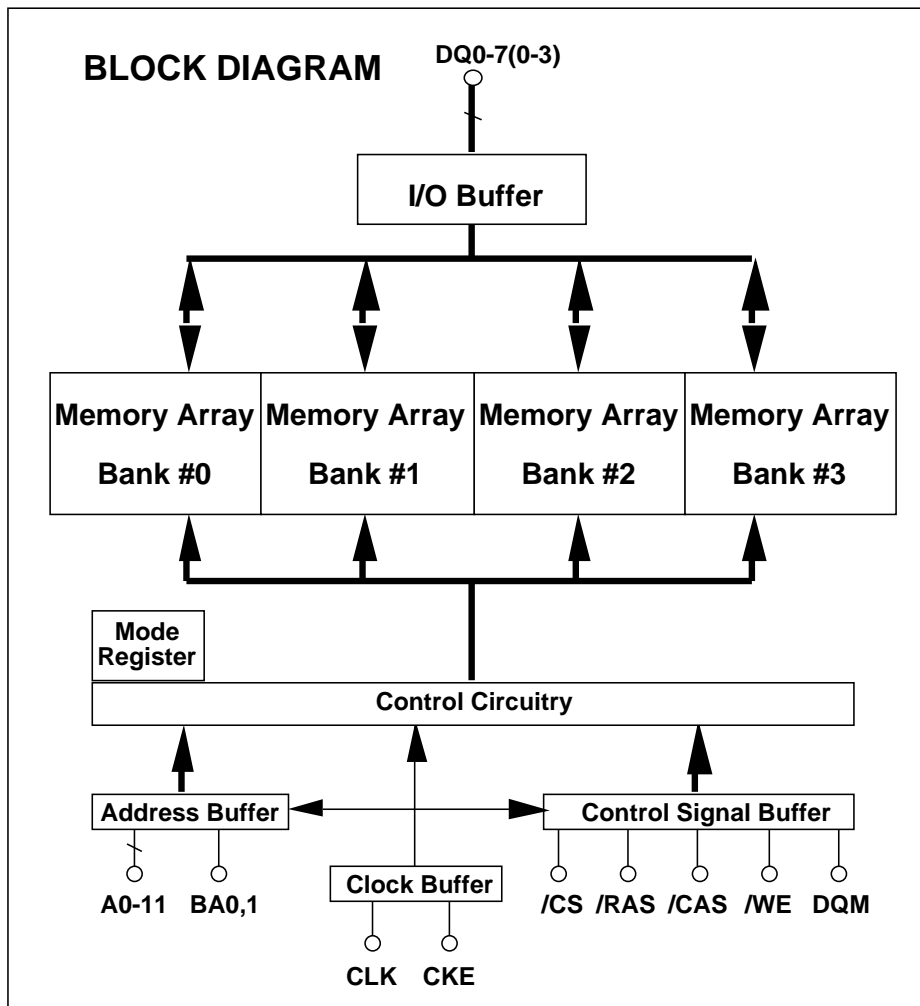

### PIN CONFIGURATION (TOP VIEW)

- CLK : Master Clock
- CKE : Clock Enable
- /CS : Chip Select
- /RAS : Row Address Strobe
- /CAS : Column Address Strobe
- /WE : Write Enable
- DQ0-3 : Data I/O
- DQM : Output Disable/ Write Mask
- A0-11 : Address Input
- BA0,1 : Bank Address
- Vdd : Power Supply
- VddQ : Power Supply for Output
- Vss : Ground
- VssQ : Ground for Output

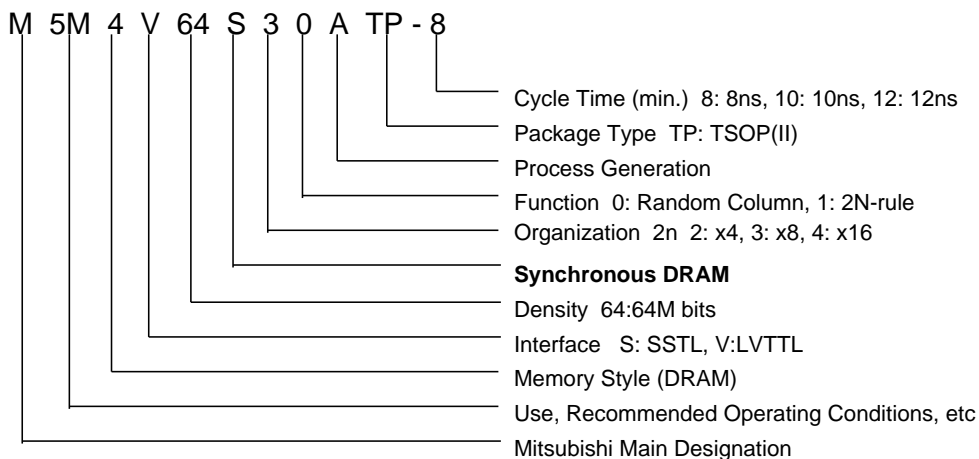

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Type Designation Code

This rule is applied to only Synchronous DRAM family.

# M5M4V64S20ATP-8, -10, -12

## 64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

### PIN FUNCTION

|                 |                |   |
|-----------------|----------------|---|
| CLK             | Input          | Master Clock: All other inputs are referenced to the rising edge of CLK.  |
| CKE             | Input          | Clock Enable: CKE controls internal clock. When CKE is low, internal clock for the following cycle is ceased. CKE is also used to select auto / self refresh. After self refresh mode is started, CKE becomes asynchronous input. Self refresh is maintained as long as CKE is low.   |
| /CS             | Input          | Chip Select: When /CS is high, any command means No Operation.  |
| /RAS, /CAS, /WE | Input          | Combination of /RAS, /CAS, /WE defines basic commands.  |
| A0-11           | Input          | A0-11 specify the Row / Column Address in conjunction with BA0,1. The Row Address is specified by A0-11. The Column Address is specified by A0-9 (x4), A0-8 (x8). A10 is also used to indicate precharge option. When A10 is high at a read / write command, an auto precharge is performed. When A10 is high at a precharge command, all banks are precharged. |
| BA0,1           | Input          | Bank Address: BA0,1 specifies one of four banks to which a command is applied. BA0,1 must be set with ACT, PRE, READ, WRITE commands.   |
| DQ0-7 (0-3)     | Input / Output | Data In and Data out are referenced to the rising edge of CLK.  |
| DQM             | Input          | Din Mask / Output Disable: When DQM is high in burst write, Din for the current cycle is masked. When DQM is high in burst read, Dout is disabled at the next but one cycle.  |
| Vdd, Vss        | Power Supply   | Power Supply for the memory array and peripheral circuitry.   |
| VddQ, VssQ      | Power Supply   | VddQ and VssQ are supplied to the Output Buffers only.  |

# M5M4V64S20ATP-8, -10, -12

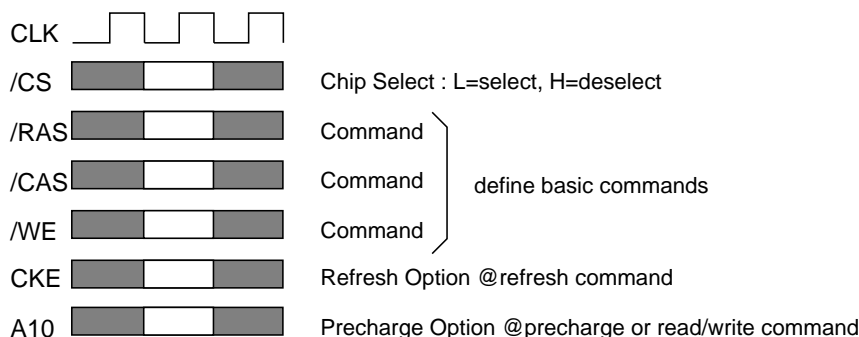

## 64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

### BASIC FUNCTIONS

The M5M4V64S20ATP provides basic functions, bank (row) activate, burst read / write, bank (row) precharge, and auto / self refresh.

Each command is defined by control signals of /RAS, /CAS and /WE at CLK rising edge. In addition to 3 signals, /CS ,CKE and A10 are used as chip select, refresh option, and precharge option, respectively.

To know the detailed definition of commands, please see the command truth table.

#### Activate (ACT) [/RAS =L, /CAS =/WE =H]

ACT command activates a row in an idle bank indicated by BA.

#### Read (READ) [/RAS =H, /CAS =L, /WE =H]

READ command starts burst read from the active bank indicated by BA. First output data appears after /CAS latency. When A10 =H at this command, the bank is deactivated after the burst read (auto-precharge, READA).

#### Write (WRITE) [/RAS =H, /CAS =/WE =L]

WRITE command starts burst write to the active bank indicated by BA. Total data length to be written is set by burst length. When A10 =H at this command, the bank is deactivated after the burst write (auto-precharge, WRITEA).

#### Precharge (PRE) [/RAS =L, /CAS =H, /WE =L]

PRE command deactivates the active bank indicated by BA. This command also terminates burst read / write operation. When A10 =H at this command, both banks are deactivated (precharge all, PREA).

#### Auto-Refresh (REFA) [/RAS =/CAS =L, /WE =CKE =H]

REFA command starts auto-refresh cycle. Refresh address including bank address are generated internally. After this command, the banks are precharged automatically.

BA=Bank Address, RA=Row Address, CA=Column Address, NOP=No Operation

NOTES:

1. All entries assume that CKE was High during the preceding clock cycle and the current clock cycle.
2. ILLEGAL to bank in specified state; function may be legal in the bank indicated by BA, depending on the state of that bank.
3. Must satisfy bus contention, bus turn around, write recovery requirements.
4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
5. ILLEGAL if any bank is not idle.

ILLEGAL = Device operation and/or data-integrity are not guaranteed.

ABBREVIATIONS:

H=High Level, L=Low Level, X=Don't Care

NOTES:

1. CKE Low to High transition will re-enable CLK and other inputs **asynchronously**. A minimum setup time must be satisfied before any command other than EXIT.
2. Power-Down and Self-Refresh can be entered only from the All Banks Idle State.
3. Must be legal command.

## SIMPLIFIED STATE DIAGRAM

# M5M4V64S20ATP-8, -10, -12

## 64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

### POWER ON SEQUENCE

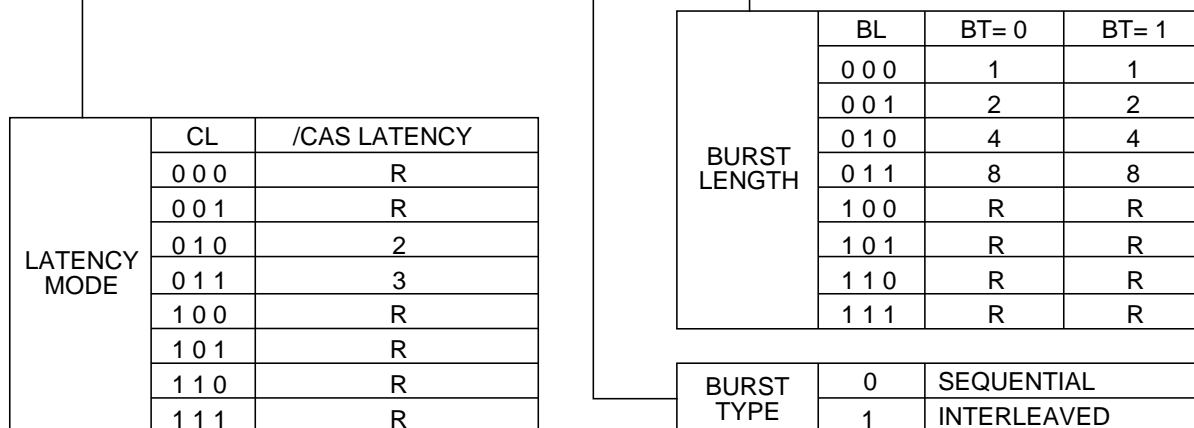

Before starting normal operation, the following power on sequence is necessary to prevent a SDRAM from damaged or malfunctioning.

1. Apply power and start clock. Attempt to maintain CKE high, DQM high and NOP condition at the inputs.
2. Maintain stable power, stable clock, and NOP input conditions for a minimum of 500µs.
3. Issue precharge commands for all banks. (PRE or PREA)
4. After all banks become idle state (after tRP), issue 8 or more auto-refresh commands.
5. Issue a mode register set command to initialize the mode register.

After these sequence, the SDRAM is idle state and ready for normal operation.

### MODE REGISTER

Burst Length, Burst Type and /CAS Latency can be programmed by setting the mode register (MRS). The mode register stores these data until the next MRS command, which may be issued when both banks are in idle state. After tRSC from a MRS command, the SDRAM is ready for new command.

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## OPERATIONAL DESCRIPTION

### BANK ACTIVATE

The SDRAM has four independent banks. Each bank is activated by the ACT command with the bank addresses (BA0,1). A row is indicated by the row addresses A11-0. The minimum activation interval between one bank and the other bank is tRRD. *Maximum 2 ACT commands are allowed within tRC*, although the number of banks which are active concurrently is not limited.

### PRECHARGE

The PRE command deactivates the bank indicated by BA0,1. When multiple banks are active, the precharge all command (PREA, PRE + A10=H) is available to deactivate them at the same time. After tRP from the precharge, an ACT command to the same bank can be issued.

### READ

After tRCD from the bank activation, a READ command can be issued. 1st output data is available after the /CAS Latency from the READ, followed by (BL -1) consecutive data when the Burst Length is BL. The start address is specified by A8-0 (x 8) / A9-0 (x 4), and the address sequence of burst data is defined by the Burst Type. A READ command may be applied to any active bank, so the row precharge time (tRP) can be hidden behind continuous output data by interleaving the multiple banks. When A10 is high at a READ command, the auto-precharge (READA) is performed. Any command (READ, WRITE, PRE, ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge starts at BL after READA. The next ACT command can be issued after (BL + tRP) from the previous READA.

## 64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

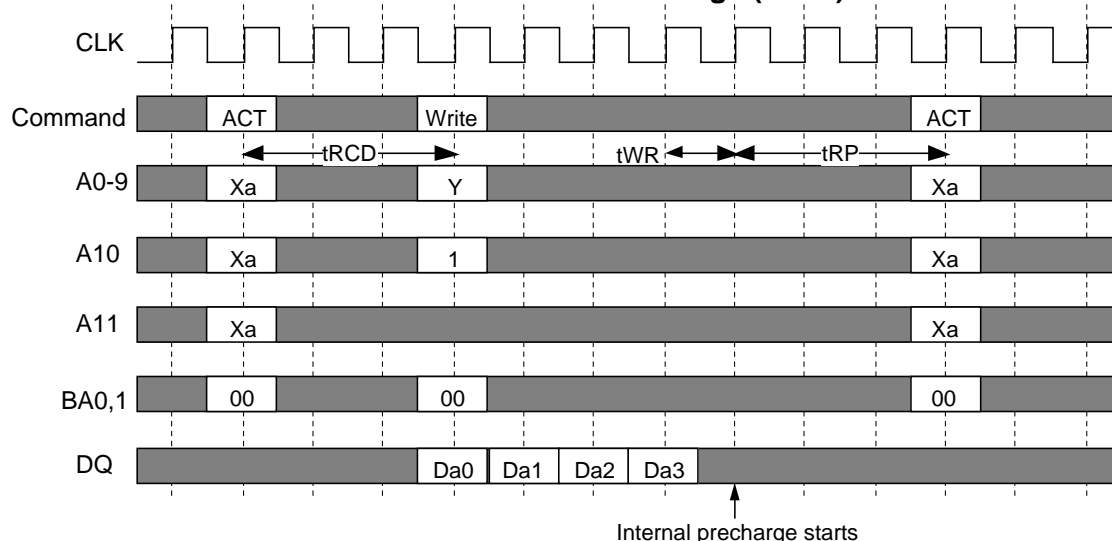

### WRITE

After tRCD from the bank activation, a WRITE command can be issued. 1st input data is set at the same cycle as the WRITE. Following (BL - 1) data are written into the RAM, when the Burst Length is BL. The start address is specified by A8-0 (x 8) / A9-0 (x 4), and the address sequence of burst data is defined by the Burst Type. A WRITE command may be applied to any active bank, so the row precharge time (tRP) can be hidden behind continuous input data by interleaving the multiple banks. From the last input data to the PRE command, the write recovery time (tWR) is required. When A10 is high at a WRITE command, the auto-precharge (WRITEEA) is performed. Any command (READ, WRITE, PRE, ACT) to the same bank is inhibited till the internal precharge is complete. The internal precharge begins at tWR after the last input data cycle. The next ACT command can be issued after tRP from the internal precharge timing.

**Multi Bank Interleaving WRITE (BL=4)**

**WRITE with Auto-Precharge (BL=4)**

## BURST INTERRUPTION

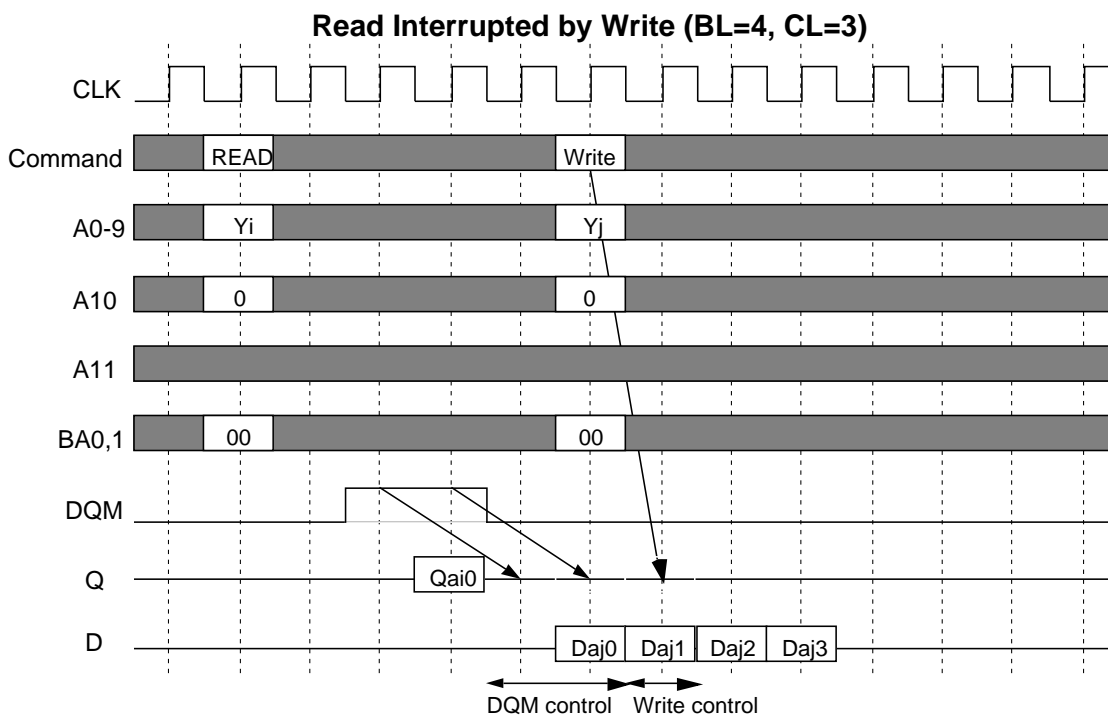

### [ Read Interrupted by Read ]

Burst read operation can be interrupted by new read of any bank. Random column access is allowed. READ to READ interval is minimum 1 CLK.

### [ Read Interrupted by Write ]

Burst read operation can be interrupted by write of any bank. Random column access is allowed. In this case, the DQ should be controlled adequately by using the DQM to prevent the bus contention. The output is disabled automatically 1 cycle after WRITE assertion.

# M5M4V64S20ATP-8, -10, -12

## 64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

### [ Read Interrupted by Precharge ]

Burst read operation can be interrupted by precharge of *the same bank*. READ to PRE interval is minimum 1 CLK. A PRE command to output disable latency is equivalent to the /CAS Latency. As a result, READ to PRE interval determines valid data length to be output. The figure below shows examples of BL=4.

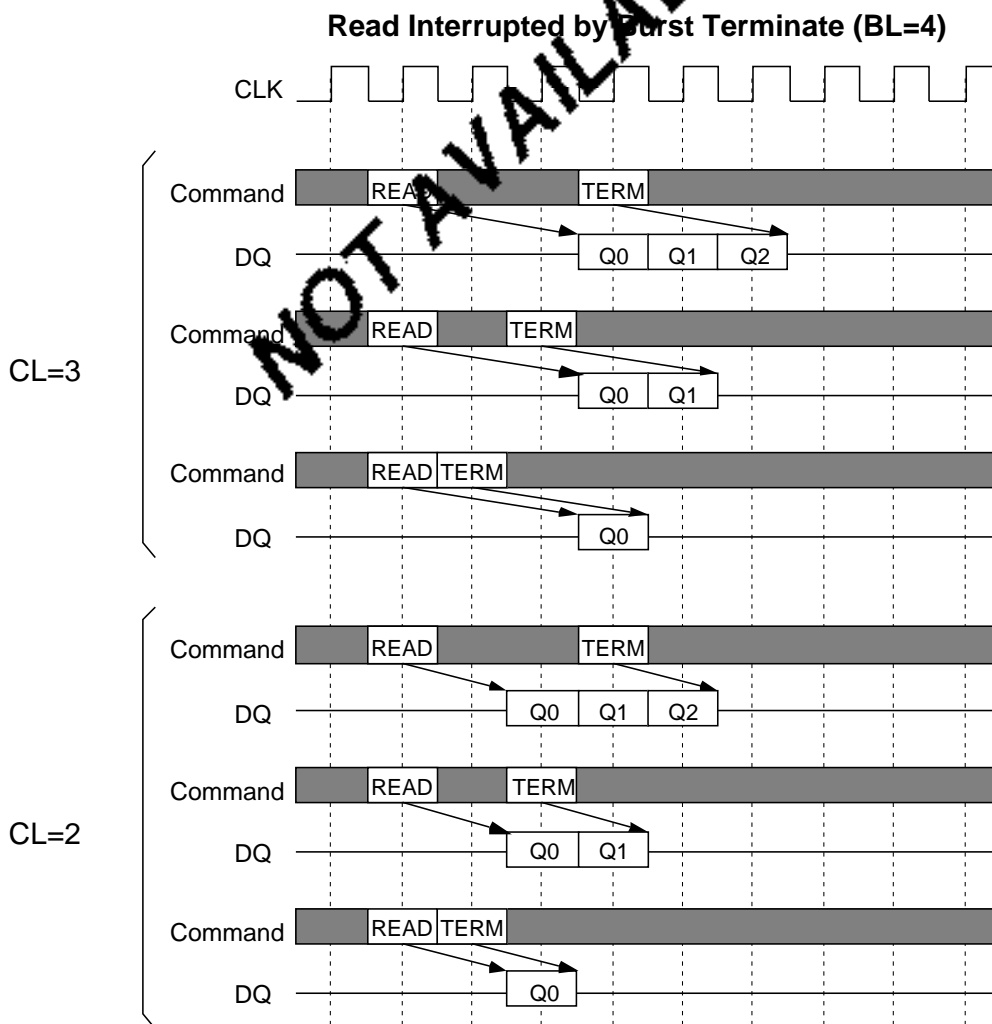

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## [ Read Interrupted by Burst Terminate ]

Similarly to the precharge, burst terminate command can interrupt burst read operation and disable the data output. The terminated banl remains active. READ to TERM interval is minimum 1 CLK. A TERM command to output disable latency is equivalent to the /CAS Latency. As a result, READ to TERM interval determines valid data length to be output. The figure below shows examples of BL=4.

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## [ Write Interrupted by Write ]

Burst write operation can be interrupted by new write of any bank. Random column access is allowed. WRITE to WRITE interval is minimum 1 CLK.

## [ Write Interrupted by Read ]

Burst write operation can be interrupted by read of the same or the other bank. Random column access is allowed. WRITE to READ interval is minimum 1 CLK. The input data on DQ at the interrupting READ cycle is "don't care".

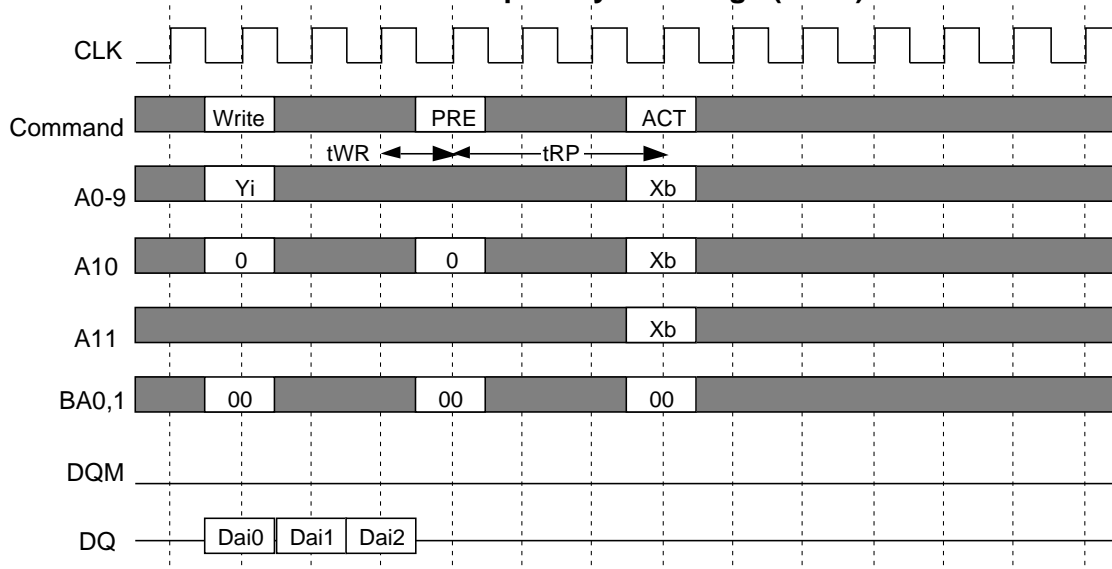

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## [ Write Interrupted by Precharge ]

Burst write operation can be interrupted by precharge of *the same bank*. Random column access is allowed. Write recovery time ( $t_{WR}$ ) is required from the last data to PRE command.

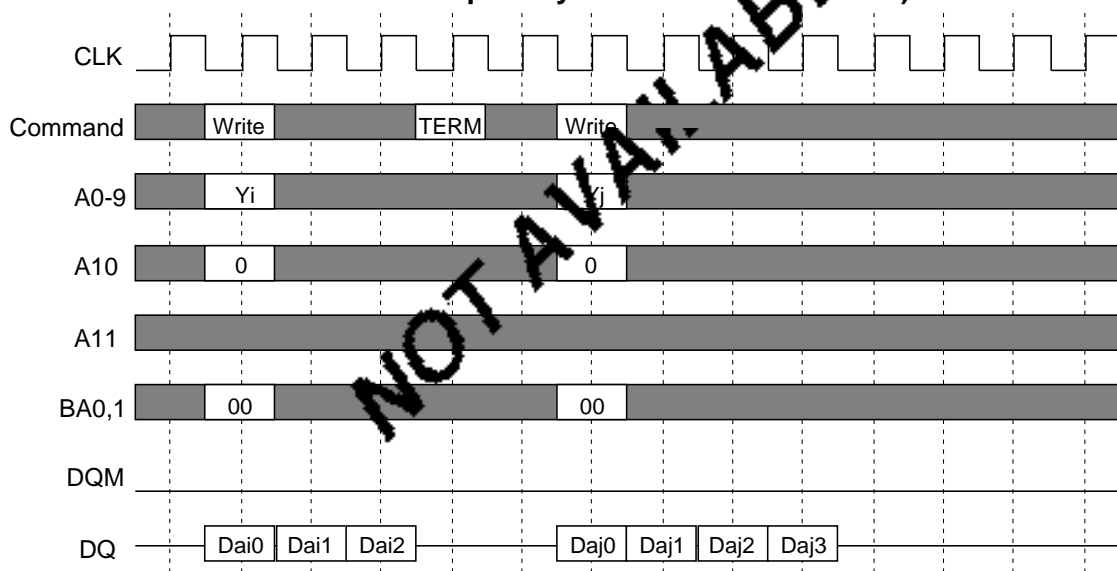

Write Interrupted by Precharge (BL=4)

## [ Write Interrupted by Burst Terminate ]

Burst terminate command can terminate burst write operation. In this case, the write recovery time is not required and the bank remains active. The figure below shows the case 3 words of data are written. Random column access is allowed. WRITE to TERM interval is minimum 1 CLK.

Write Interrupted by Burst Terminate (BL=4)

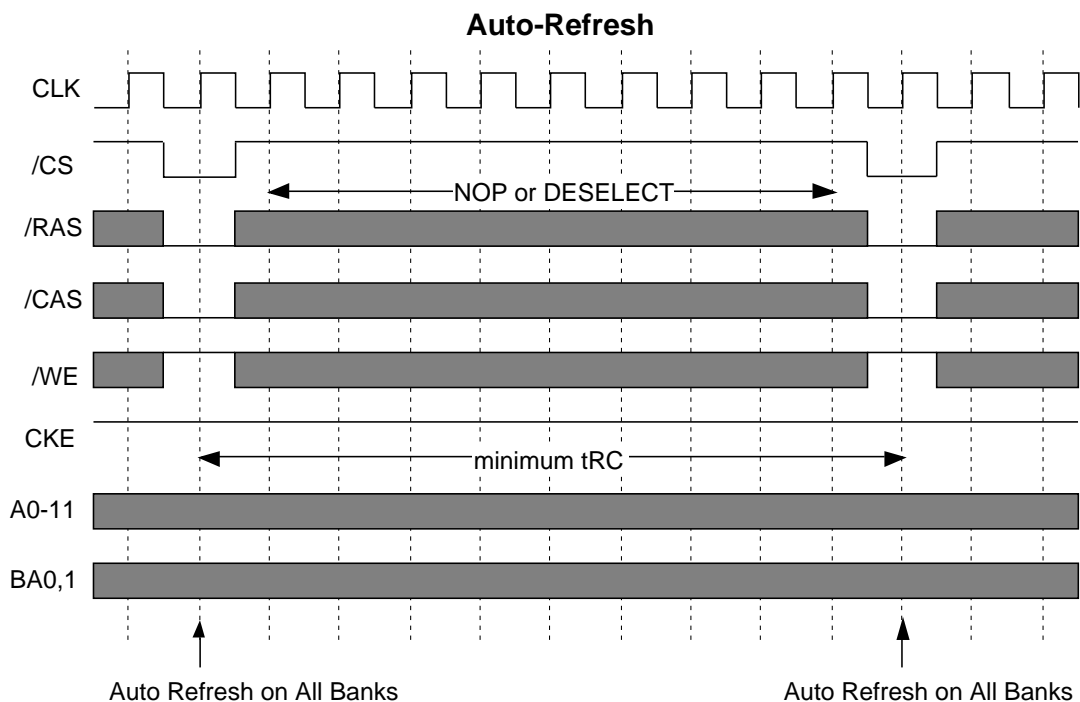

# M5M4V64S20ATP-8, -10, -12

## 64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

### AUTO REFRESH

Single cycle of auto-refresh is initiated with a REFA (/CS= /RAS= /CAS= L, /WE= /CKE= H) command. The refresh address is generated internally. 4096 REFA cycles within 64ms refresh 64Mbit memory cells. The auto-refresh is performed on 4 banks concurrently. Before performing an auto-refresh, all banks must be in the idle state. Auto-refresh to auto-refresh interval is minimum tRC. Any command must not be supplied to the device before tRC from the REFA command.

# M5M4V64S20ATP-8, -10, -12

## 64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

### SELF REFRESH

Self-refresh mode is entered by issuing a REFS command ( $\overline{CS} = \overline{RAS} = \overline{CAS} = L, \overline{WE} = H, CKE = L$ ). Once the self-refresh is initiated, it is maintained as long as CKE is kept low. During the self-refresh mode, CKE is asynchronous and the only enabled input, all other inputs including CLK are disabled and ignored, so that power consumption due to synchronous inputs is saved. To exit the self-refresh, supplying stable CLK inputs, asserting DESEL or NOP command and then asserting CKE (REFSX) for longer than  $t_{SRX}$ . After  $t_{RC}$  from REFSX all banks are in the idle state and a new command can be issued, but DESEL or NOP commands must be asserted till then.

### Self-Refresh

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## CLK SUSPEND

CKE controls the internal CLK at the following cycle. Figure below shows how CKE works. By negating CKE, the next internal CLK is suspended. The purpose of CLK suspend is power down, output suspend or input suspend. CKE is a synchronous input except during the self-refresh mode. CLK suspend can be performed either when the banks are active or idle. A command at the suspended cycle is ignored.

### Power Down by CKE

### DQ Suspend by CKE

# M5M4V64S20ATP-8, -10, -12

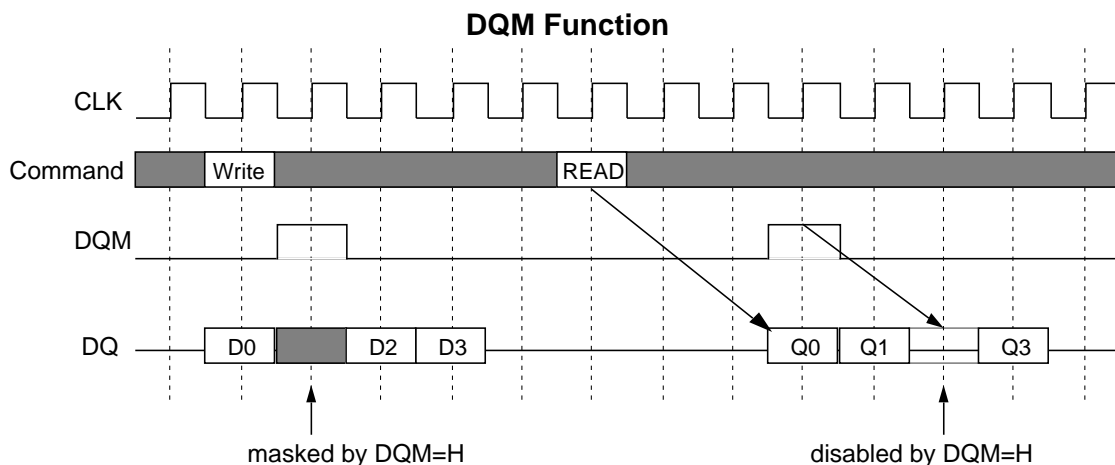

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## DQM CONTROL

DQM is a dual function signal defined as the data mask for writes and the output disable for reads.

During writes, DQM masks input data word by word. DQM to write mask latency is 0.

During reads, DQM forces output to Hi-Z word by word. DQM to output Hi-Z latency is 2.

### Output Load Condition

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Burst Write (single bank) @BL=4

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Burst Write (multi bank) @BL=4

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Burst Read (single bank) @BL=4 CL=3

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Burst Read (multiple bank) @BL=4 CL=3

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Burst Write (multi bank) with Auto-Precharge @BL=4

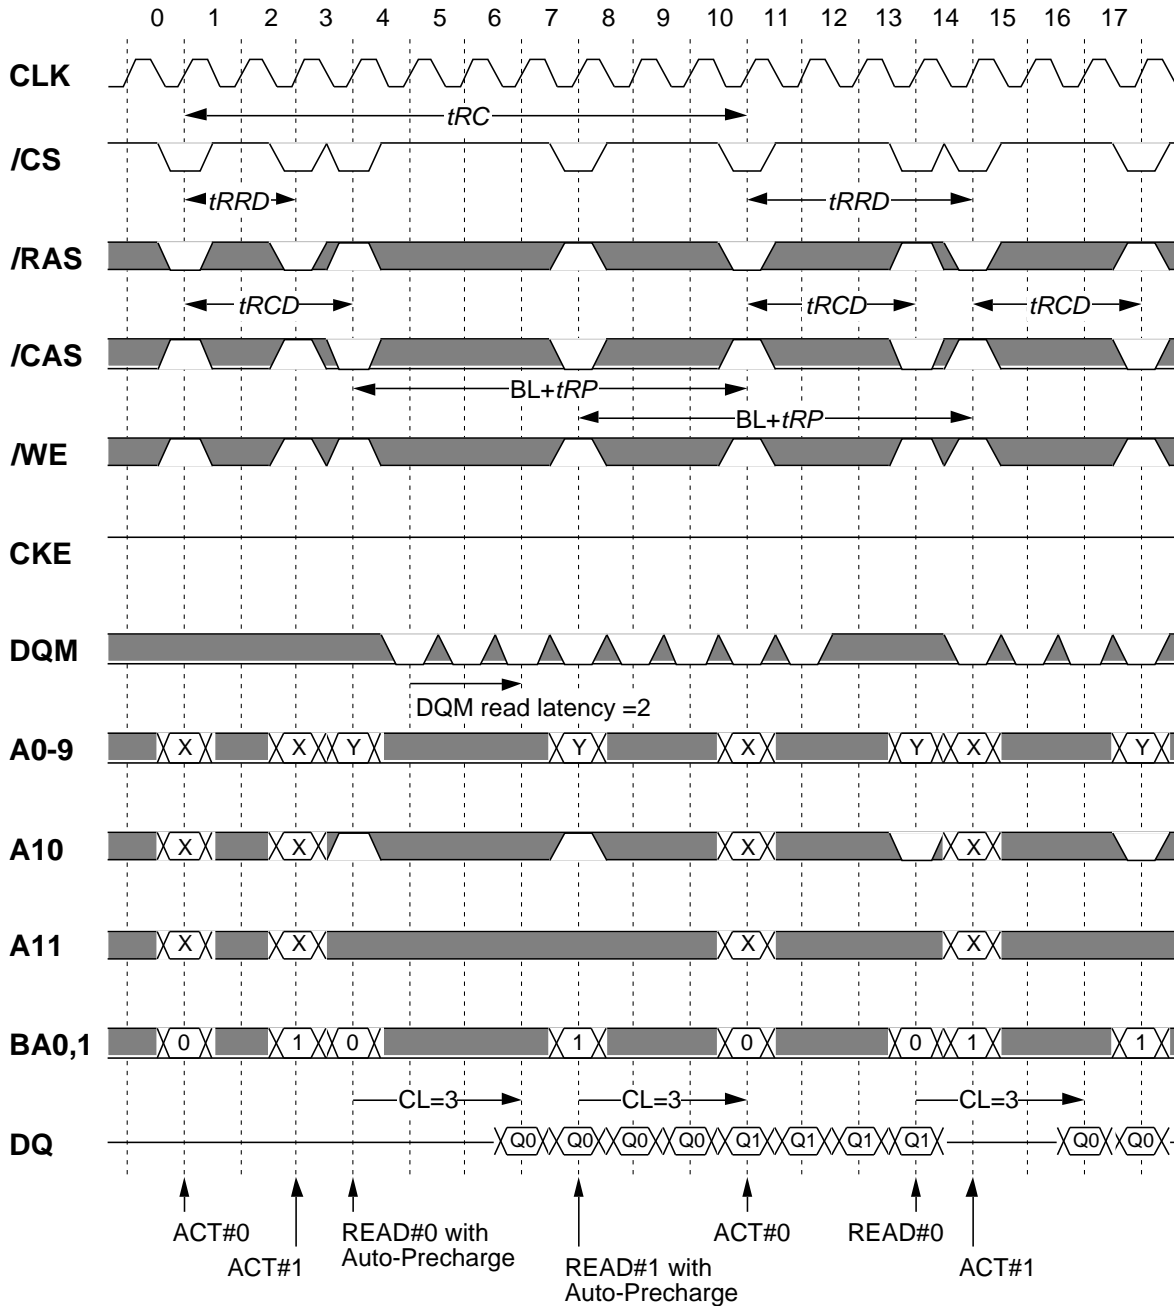

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Burst Read (multiple bank) with Auto-Precharge @BL=4 CL=3

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Page Mode Burst Write (multi bank) @BL=4

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Page Mode Burst Read (multi bank) @BL=4 CL=3

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Write Interrupted by Write / Read @BL=4

Burst Write can be interrupted by Write or Read of any active bank.

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Read Interrupted by Read / Write @BL=4 CL=3

Burst Read can be interrupted by Read or Write of any active bank.

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Write Interrupted by Precharge @BL=4

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Read Interrupted by Precharge @BL=4 CL=3

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Mode Register Setting

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Auto-Refresh @BL=4

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Self-Refresh

Before Self-Refresh Entry, all banks must be idle state.

After  $t_{RC}$  from Self-Refresh Exit, all banks are idle state.

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## DQM Write Mask @BL=4

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## DQM Read Mask @BL=4 CL=3

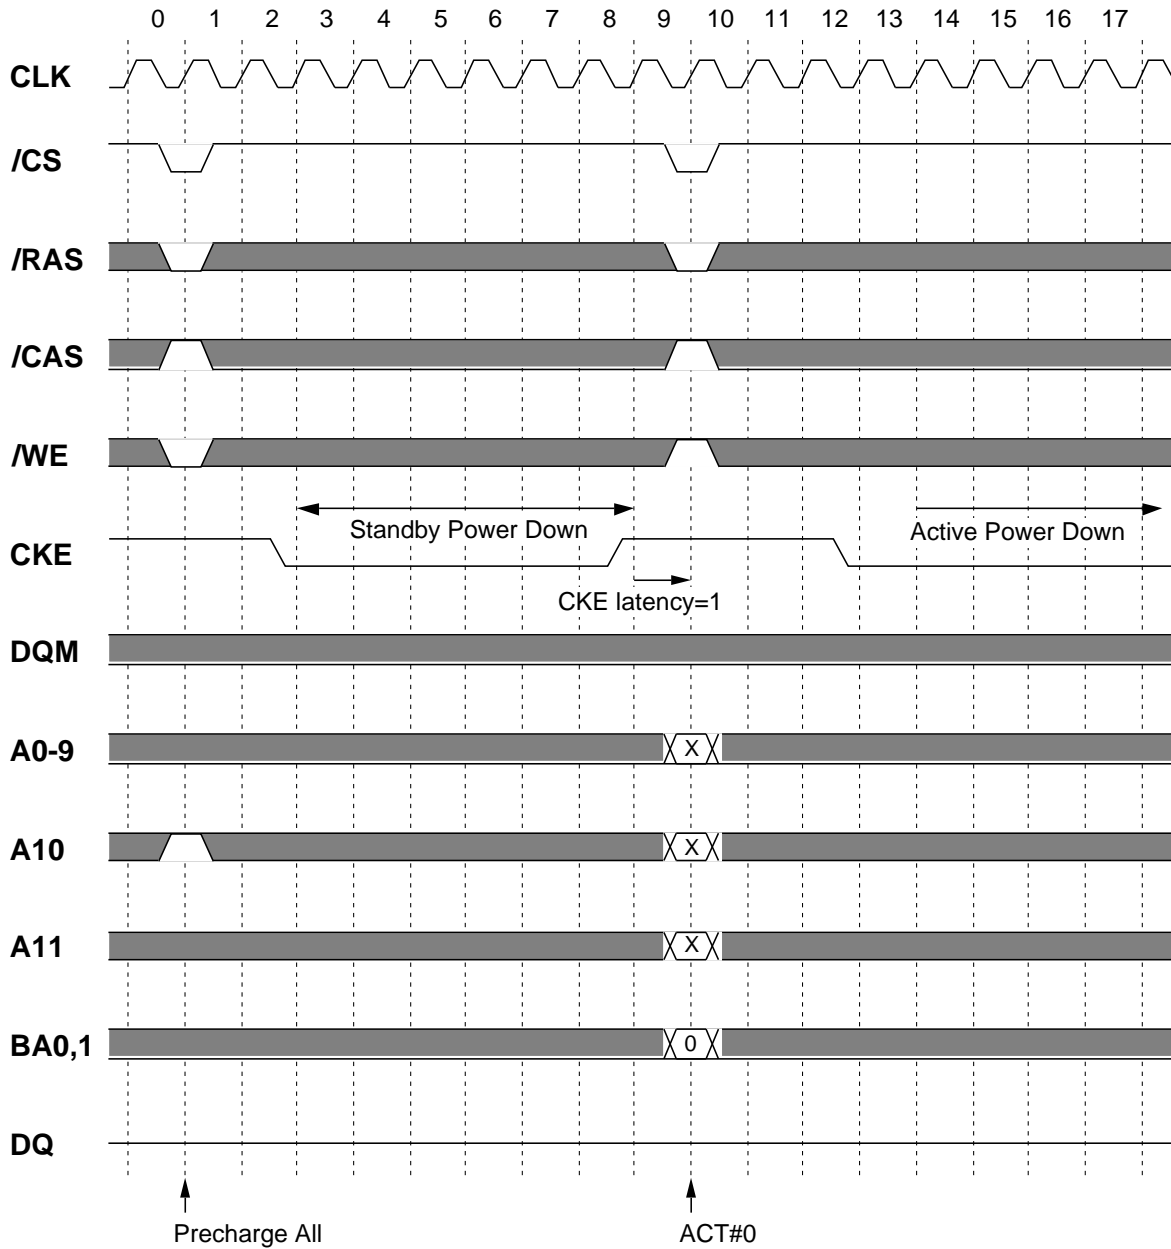

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## Power Down

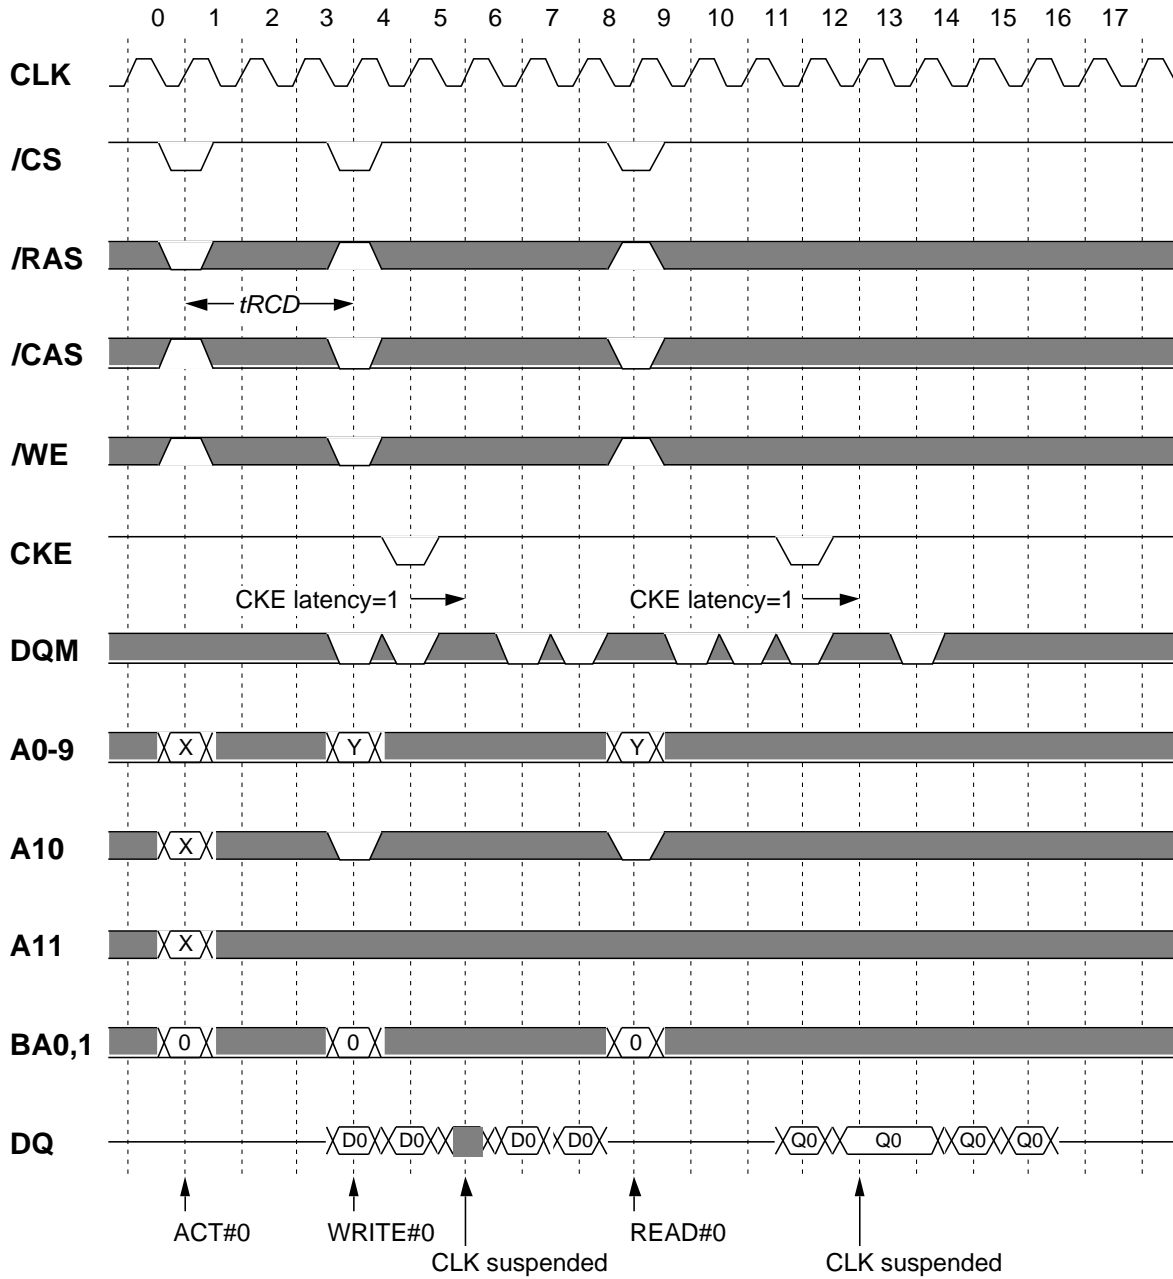

*Italic parameter* indicates minimum case

# M5M4V64S20ATP-8, -10, -12

64M (4-BANK x 4194304-WORD x 4-BIT) Synchronous DRAM

## CLK Suspend @BL=4 CL=3

*Italic parameter* indicates minimum case
