## MSC23Q436D-xxBS9/DS9

**4,194,304-word x 36-bit DYNAMIC RAM MODULE : FAST PAGE MODE TYPE**

### DESCRIPTION

The MSC23Q436D-xxBS9/DS9 is a 4,194,304-word x 36-bit CMOS dynamic random access memory module which is composed of eight 16Mb DRAMs (4Mx4) in SOJ packages and one 16Mb DRAM (4/CAS 4Mx4) in SOJ package mounted with nine decoupling capacitors. This is a 72-pin single in-line memory module. This module supports any application where high density and large capacity of storage memory are required.

### FEATURES

- 4,194,304-word x 36-bit organization
- 72-pin Single In-Line Memory Module
  - MSC23Q436D-xxBS9 : Gold tab
  - MSC23Q436D-xxDS9 : Solder tab
- Single 5V power supply,  $\pm 10\%$  tolerance
- Input : TTL compatible
- Output : TTL compatible, 3-state
- Refresh : 2048cycles/32ms
- Fast page mode capability
- /CAS before /RAS refresh, hidden refresh, /RAS only refresh capability
- Multi-bit test mode capability

- Notes:
1. A start-up delay of 200 $\mu$ s is required after power-up, followed by a minimum of eight initialization cycles (/RAS only refresh or /CAS before /RAS refresh) before proper device operation is achieved.
  2. The AC characteristics assumes  $t_T = 5$ ns.
  3.  $V_{IH}(\text{Min.})$  and  $V_{IL}(\text{Max.})$  are reference levels for measuring input timing signals. Transition times ( $t_T$ ) are measured between  $V_{IH}$  and  $V_{IL}$ .
  4. This parameter is measured with a load circuit equivalent to 2 TTL loads and 100pF.
  5. Operation within the  $t_{RCD}(\text{Max.})$  limit ensures that  $t_{RAC}(\text{Max.})$  can be met.  $t_{RCD}(\text{Max.})$  is specified as a reference point only. If  $t_{RCD}$  is greater than the specified  $t_{RCD}(\text{Max.})$  limit, then the access time is controlled by  $t_{CAC}$ .
  6. Operation within the  $t_{RAD}(\text{Max.})$  limit ensures that  $t_{RAC}(\text{Max.})$  can be met.  $t_{RAD}(\text{Max.})$  is specified as a reference point only. If  $t_{RAD}$  is greater than the specified  $t_{RAD}(\text{Max.})$  limit, then the access time is controlled by  $t_{AA}$ .
  7.  $t_{OFF}(\text{Max.})$  define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
  8.  $t_{RCH}$  or  $t_{RRH}$  must be satisfied for a read cycle.
  9. The test mode is initiated by performing a /WE and /CAS before /RAS refresh cycle. This mode is latched and remains in effect until the exit cycle is generated. The test mode specified in this data sheet is a 4-bit parallel test function. CA0 and CA1 are not used. In a read cycle, if all internal bits are equal, the DQ pin will indicate a high level. If any internal bits are not equal, the DQ pin will indicate a low level. The test mode is cleared and the memory device returned to its normal operating state by a /RAS only refresh or /CAS before /RAS refresh cycle.
  10. In a test mode read cycle, the value of access time parameters is delayed for 5ns for the specified value. These parameters should be specified in test mode cycle by adding the above value to the specified value in this data sheet.
