## General Description

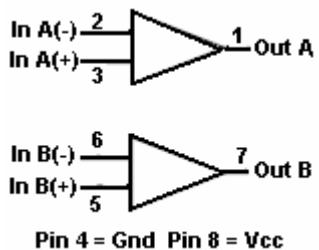

The TS2903 is dual independent precision voltage comparators capable of single-supply or split-supply operation. The specifications as low as 2.0 mV make this device an excellent ground level with single-supply operation. Input offset-voltage selection for many applications in consumer automotive, and It is designed to permit a common mode range-to- industrial electronics.

The TS2903 is offered in 8 pin SOP-8 and DIP-8 package.

## Features

- ◊ Output voltage compatible with DTL, ECL, TTL, MOS and CMOS Logic Levels
- ◊ Low input bias current -25nA
- ◊ Low input offset current  $\pm 5\text{nA}$
- ◊ Low input offset voltage  $\pm 3\text{mV}(\text{max})$
- ◊ Input common mode range to ground level
- ◊ Differential Input voltage range equal to power supply voltage
- ◊ Very low current drain independent of supply voltage - 0.4mA
- ◊ Wide single-supply range 2V to 36V
- ◊ Split-supply range  $\pm 1\text{V}$  to  $\pm 18\text{V}$

## Electrical Characteristics (Continues)

- Note 1. The max. Output current may be as high as 20mA, independent of the magnitude of  $V_{CC}$ , output short circuits to  $V_{CC}$  can cause excessive heating and eventual destruction.
- Note 2. This magnitude of input current will only occur if the input leads are driven more negative than ground or the negative supply voltage. This is due to the input PNP collector base junction becoming forward biased acting as an input clamp diode. There is also a lateral PNP parasitic transistor action on the IC chip. This phenomena can cause the output voltage of the comparators to go to the  $V_{CC}$  voltage level (or ground if overdrive is large) during the time the input is driven negative. This will not destroy the device and normal output states will recover when the inputs become -0.3V of ground or negative supply.
- Note 3. At output switch point,  $V_O=1.4Vdc$ ,  $R_S=0\Omega$  with  $V_{CC}$  from 5Vdc to 30Vdc, and over the full input common-mode range.
- Note 4. Due to the PNP transistor inputs, bias current will flow out of the inputs, this current is essentially constant independent of the output state, therefore, no loading changes will exist on the input lines.
- Note 5. Input common mode of either input should not be permitted to go more than 0.3V negative of ground or minus supply. The upper limit of common mode range is  $V_{CC} - 1.5V$  but either or both inputs can be taken to as high as 30volts without damage.
- Note 6. Response time is specified with a 100mV step and 5.0mV of overdrive. With larger magnitudes of overdrive faster response times are obtainable.
- Note 7. The comparator will inhibit proper output state if one of the inputs is become greater than  $V_{CC}$ , the other input must remain within the common mode range. The low input state must not be less than -0.3volts of ground or minus supply.

## Applications Information

This dual comparator feature high gain, wide bandwidth characteristics. This gives the device oscillation tendencies if the outputs are capacitive coupled to the inputs via stray capacitance. This oscillation manifests itself during output transitions ( $V_{OL}$  to  $V_{OH}$ ). To alleviate this situation input resistors  $<10\text{ k}\Omega$  should be used. The addition of positive feedback ( $<10\text{ mV}$ ) is also recommended.

It is good design practice to ground all unused pins. Differential input voltages may be larger than supply voltage without damaging the comparator's inputs. Voltages more negative than  $-0.3\text{ V}$  should not be used.
