

STA326

2.1 HIGH EFFICIENCY DIGITAL AUDIO SYSTEM

1 FEATURES

- Wide supply voltage range (10-36V)
- 3 Power Output Configurations
 - 2x30W + 1x60W, 8Ω+4Ω @ 10% THD
 - 2x60W, 8Ω @ 10% THD
 - 1x120W, 4Ω @ 10% THD
- Power SO-36 Package
- 2.1 Channels of 24-Bit DDX®
- 100dB SNR and Dynamic Range
- 32kHz to 192kHz Input Sample Rates
- Digital Gain/Attenuation +48dB to -80dB in 0.5dB steps
- 4 x 22-bit User Programmable Biquads (EQ) per Channel
- I²C Control
- 2-Channel I²S Input Data Interface
- Individual Channel and Master Gain/Attenuation
- Individual Channel and Master Soft and Hard Mute
- Individual Channel Volume and EQ Bypass
- Bass/Treble Tone Control
- Dual Independent Programmable Limiters/Compressors
- Automodes™
 - 31 Preset EQ Curves
 - 15 Preset Crossover Settings
 - Auto Volume Controlled Loudness
 - 3 Preset Volume Curves
 - 2 Preset Anti-Clipping Modes
 - Preset Nighttime Listening Mode
 - Preset TV AGC
- Input and Output Channel Mapping
- AM Noise Reduction and PWM Frequency Shifting Modes
- Soft Volume Update and Muting
- Auto Zero Detect and Invalid Input Detect Muting
- Over Current and over-temperature protection with programmable recovery
- Thermal warning indicator with programmable auto output power reduction
- Selectable De-emphasis

Figure 1. Package

Table 1. Order Codes

Part Number	Package
STA326	PowerSO36 (Slug up)
STA32613TR	Tape & Reel

- Post-EQ User Programmable Mix with default 2.1 Bass Management settings
- Variable Max Power Correction for lower full-power THD
- 4 Output Routing Configurations
- Selectable Clock Input Ratio
- 96kHz Internal Processing Sample Rate, 24 to 28-bit precision
- QXpander
- Video Application: 576 fs input mode supporting

2 DESCRIPTION

The STA326 is an integrated solution of digital audio processing, digital amplifier control, and DDX-Power Output Stage, thereby creating a high-power single-chip DDX® solution comprising of high-quality, high-efficiency, all digital amplification.

The STA326 can be configured via digital control to operate in several output modes providing up to 2.1 channels of power output to speakers.

This device is capable to deliver up to 2x30W + 1x60W in 2.1 mode or 2x60W in stereo mode.

The IC can also be configured as a single paralleled full-bridge capable of high-current operation and 1x120W output.

Also provided in the STA326 are a full assortment of digital processing features. This includes up to 4 programmable 28-bit biquads (EQ) per channel, and bass/treble tone control. Automodes™ enable a time-to-market advantage by substantially reducing the amount of software development needed for certain functions. This includes Auto

Volume loudness, preset volume curves, preset EQ settings, etc. New advanced AM radio interference reduction modes.

The serial audio data input interface accepts all possible formats, including the popular I₂S format.

Three channels of DDX® processing are provided. This high quality conversion from PCM audio to DDX's patented tri-state PWM switching waveform provides over 100dB SNR and dynamic range.

Figure 2.

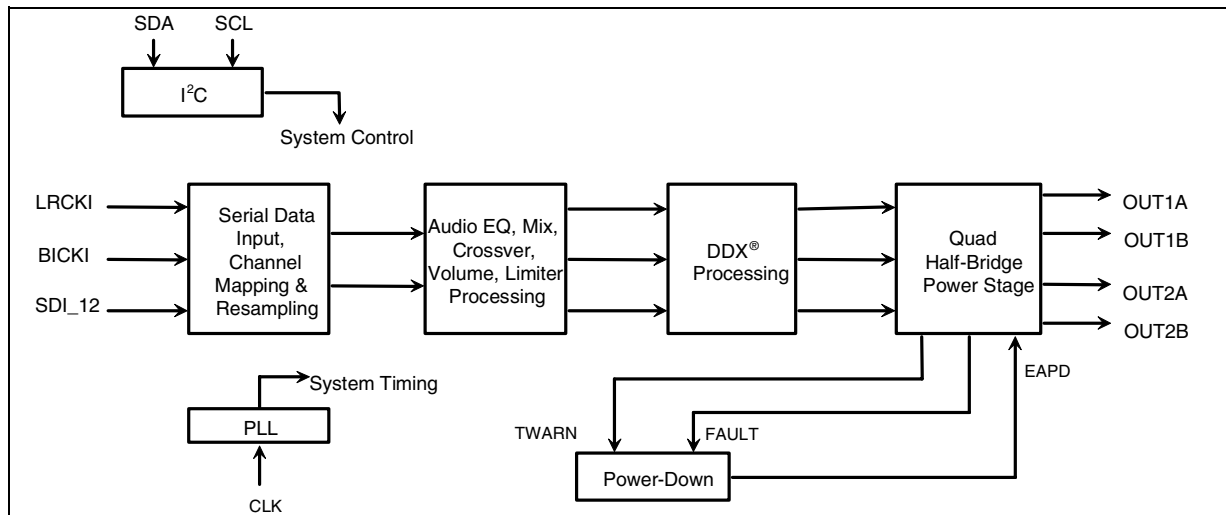

Figure 3. Channel Signal Flow Diagram through the Digital Core

2.1 EQ Processing

Two channels of input data (re-sampled if necessary) at 96 kHz are provided to the EQ processing block. In this block, upto 4 user-defined Biquads can be applied to each of the two channels.

Pre-scaling, dc-blocking high-pass, de-emphasis, bass, and tone control filters can also be applied based on various configuration parameter settings.

The entire EQ block can be bypassed for all channels simultaneously by setting the DSPB bit to '1'. And the CxEQBP bits can be used to bypass the EQ functionality on a per channel basis. Figure below shows the internal signal flow through the EQ block.

2.2 Mix Processing

The Post-EQ Mix block takes the two channel outputs from the EQ block and outputs three channels of data. By default, Channels 1 and 2 outputs are essentially pass-through of Channels 1 and 2 inputs coming from the EQ block. An additional channel is created as a result of a sum & mix of the two input channels. See Figure 30. By default, this 3rd channel of data is an equal mix of channel 1 and 2 data. Normally this third channel will be used as the subwoofer in the 2.1 configuration. An additional filtering stage is found after the mix block in order to implement crossover filtering. The crossover filters can be automatically configured from the AutoMode Crossover (XO) bits or these filters can be manually programmed for any type and frequency crossover.

2.3 Output Mode Configurations

P_o	Mono mode output power	THD = 10% $R_L = 4\Omega$; $V_S = 32V$		60 120		W W
THD+N	Total Harmonic Distortion + Noise	$P_o = 1 W_{rms}$ $P_o = 40 W_{rms}$		0.07 0.1		%
SNR	Signal to Noise Ratio	A-Weighted DDX® Mode		99		dB
	Signal to Noise Ratio, Binary Half-Bridge Mode	Binary Mode A-Weighted		92		dB
η	Efficiency	DDX® Mode		89		%
		Binary		87		%

5 FUNCTIONAL DESCRIPTION

5.1 PIN DESCRIPTION

5.1.1 OUT1A, 1B, 2A & 2B (Pins 16, 10, 9 & 3)

Output Half Bridge PWM Outputs 1A, 1B, 2A & 2B provide the inputs signals to the speaker devices.

Half Bridge Power Outputs 1A, 1B, 2A & 2B deliver audio power to the speaker loads. Using DDX stereo configuration mode, outputs 1A (+) and 1B (-) comprise Channel 1 and outputs 2A (+) and 2B (-) comprise Channel 2. Using binary 2.1 channel configuration mode, output 1A is for Channel 1 and output 1B is for Channel 2 and outputs 2A (+) and 2B (-) comprise Channel 3. Using DDX mono-high power output mode (Config connected to VREG1), outputs 1A and 1B are shorted (+) and outputs 2A and 2B are shorted (-) comprising a single BTL output with twice output current capability for Channel 3.

5.1.2 RESET (Pin 22)

Driving RESET low sets all outputs low and returns all register settings to their defaults. The reset is asynchronous to the internal clock.

5.1.3 I²C Signals (Pins 23 & 24)

The SDA (I2C Data) and SCL (I2C Clock) pins operate per the I2C specification. See Section 4.0. Fast-mode (400kB/sec) I2C communication is supported.

5.1.4 GNDA & VDDA: Phase Locked Loop Power (Pins 28-29)

The phase locked loop power is applied here. This +3.3V supply must be well bypassed and filtered for noise immunity. The audio performance of the device is critically dependent upon the PLL circuit.

5.1.5 CLK: Master Clock In (Pin 27)

This is the master clock in required for the operation of the digital core. The master clock must be an integer multiple of the LR clock frequency. Typically, the master clock frequency is 12.288 MHz (256*Fs) for a 48kHz sample rate, which is the default at power-up. Care must be taken to avoid over-clocking the device i.e provide the device with the nominally required system clock; otherwise, the device may not properly operate or be able to communicate.

5.1.6 FILTER_PLL: PLL Filter (Pin 26)

PLL Filter connects to external filter components for PLL loop compensation. Refer to the schematic diagram for the recommended circuit.

5.1.7 BICKI: Bit Clock In (Pin 32)

The serial or bit clock input is for framing each data bit. The bit clock frequency is typically 64*Fs, for example using I2S serial format.

5.1.8 SDI_12: Serial Data Input (Pin 30)

PCM audio information enters the device here. Six format choices are available including I2S, left- or right-justified, LSB or MSB first, with word widths of 16, 18, 20 and 24 bits.

5.1.9 CONFIG: Configuration input (Pin 21)

The configuration input pin is normally connected to ground. Using the mono-high power BTL configuration requires the CONFIG input pin be shorted to VREG1.

5.1.10 LRCKI: Left/Right Clock In (Pin 31)

The Left/Right clock input is for data word framing. The clock frequency will be at the input sample rate Fs.

5.2 AUDIO PERFORMANCE

TBD

6 STA326 I²C BUS SPECIFICATION

The STA326 supports the I2C protocol. This protocol defines any device that sends data on to the bus as a transmitter and any device that reads the data as a receiver. The device that controls the data transfer is known as the master and the other as the slave. The master always starts the transfer and provides the serial clock for synchronization. The STA326 is always a slave device in all of its communications.

6.1 COMMUNICATION PROTOCOL

6.1.1 Data Transition or change

Data changes on the SDA line must only occur when the SCL clock is low. SDA transition while the clock is high is used to identify a START or STOP condition.

6.1.2 Start Condition

START is identified by a high to low transition of the data bus SDA signal while the clock signal SCL is stable in the high state. A START condition must precede any command for data transfer.

6.1.3 Stop Condition

STOP is identified by a low to high transition of the data bus SDA signal while the clock signal SCL is stable in the high state. A STOP condition terminates communication between STA326 and the bus master.

6.1.4 Data Input

During the data input the STA326 samples the SDA signal on the rising edge of clock SCL. For correct device operation the SDA signal must be stable during the rising edge of the clock and the data can change only when the SCL line is low.

6.2 DEVICE ADDRESSING

To start communication between the master and the STA326, the master must initiate with a start condition. Following this, the master sends 8-bits (MSB first) onto the SDA line corresponding to the device select address and read or write mode.

The 7 most significant bits are the device address identifiers, corresponding to the I2C bus definition. In the STA326 the I2C interface uses a device address of 0x34 or 0011010x.

The 8th bit (LSB) identifies read or write operation, RW. This bit is set to 1 in read mode and 0 for write mode. After a START condition the STA326 identifies the device address on the bus. If a match is found, it acknowledges the identification on the SDA bus during the 9th bit time. The byte following the device identification byte is the internal space address.

6.3 WRITE OPERATION

Following the START condition the master sends a device select code with the RW bit set to 0. The STA326 acknowledges this and then the master writes the internal address byte.

After receiving the internal byte address the STA326 again responds with an acknowledgement.

6.3.1 Byte Write

In the byte write mode the master sends one data byte. This is acknowledged by the STA326. The master then terminates the transfer by generating a STOP condition.

6.3.2 Multi-byte Write

The multi-byte write modes can start from any internal address. Sequential data byte writes will be written to sequential addresses within the STA326.

The master generating a STOP condition terminates the transfer.

6.4 READ OPERATION

6.4.1 Current Address Byte Read

Following the START condition the master sends a device select code with the RW bit set to 1. The STA326 acknowledges this and then responds by sending one byte of data. The master then terminates the transfer by generating a STOP condition.

6.4.1.1 Current Address Multi-byte Read

The multi-byte read modes can start from any internal address. Sequential data bytes will be read from sequential addresses within the STA326. The master acknowledges each data byte read and then generates a STOP condition terminating the transfer.

6.4.2 Random Address Byte Read

Following the START condition the master sends a device select code with the RW bit set to 0. The STA326 acknowledges this and then the master writes the internal address byte. After receiving, the internal byte address the STA326 again responds with an acknowledgement. The master then initiates another START condition and sends the device select code with the RW bit set to 1. The STA326 acknowledges this and then responds by sending one byte of data. The master then terminates the transfer by generating a STOP condition.

6.4.2.1 Random Address Multi-byte Read

The multi-byte read modes could start from any internal address. Sequential data bytes will be read from sequential addresses within the STA326. The master acknowledges each data byte read and then generates a STOP condition terminating the transfer.

7.1.1 Master Clock Select

BIT	R/W	RST	NAME	DESCRIPTION
0	R/W	1	MCS0	Master Clock Select: Selects the ratio between the input I ² S sample frequency and the input clock.
1	R/W	1	MCS1	
2	R/W	0	MCS2	

The STA326 will support sample rates of 32kHz, 44.1kHz, 48kHz, 88.2kHz, and 96kHz. Therefore the internal clock will be:

- 32.768Mhz for 32kHz
- 45.1584Mhz for 44.1kHz, 88.2kHz, and 176.4kHz
- 49.152Mhz for 48kHz, 96kHz, and 192kHz

The external clock frequency provided to the XTI pin must be a multiple of the input sample frequency (fs). The correlation between the input clock and the input sample rate is determined by the status of the MCSx bits and the IR (Input Rate) register bits. The MCSx bits determine the PLL factor generating the internal clock and the IR bit determines the oversampling ratio used internally.

Table 7. IR and MCS Settings for Input Sample Rate and Clock Rate

Input Sample Rate fs (kHz)	IR	MCS(2..0)					
		000	001	010	011	100	101

7.1.2 Interpolation Ratio Select

BIT	R/W	RST	NAME	DESCRIPTION
4...3	R/W	00	IR (1...0)	Interpolation Ratio Select: Selects internal interpolation ratio based on input I ² S sample frequency

The STA326 has variable interpolation (re-sampling) settings such that internal processing and DDX output rates remain consistent. The first processing block interpolates by either 2 times or 1 time (pass-through) or provides a down-sample by a factor of 2.

The IR bits determine the re-sampling ratio of this interpolation.

Table 8. IR bit settings as a function of Input Sample Rate

Input Sample Rate Fs (kHz)	IR (1,0)	1 st Stage Interpolation Ratio
32	00	2 times over-sampling
44.1	00	2 times over-sampling
48	00	2 times over-sampling
88.2	01	Pass-Through
96	01	Pass-Through
176.4	10	Down-sampling by 2
192	10	Down-sampling by 2

7.1.3 Thermal Warning Recovery Bypass

BIT	R/W	RST	NAME	DESCRIPTION
5	R/W	1	TWRB	Thermal-Warning Recovery Bypass: 0 – Thermal warning Recovery enabled 1 – Thermal warning Recovery disabled

If the Thermal Warning Adjustment is enabled (TWAB=0), then the Thermal Warning Recovery will determine if the adjustment is removed when Thermal Warning is negative. If TWRB=0 and TWAB=0, then when a thermal warning disappears the gain adjustment determined by the Thermal Warning Post-Scale(default = -3dB) will be removed and the gain will be added back to the system. If TWRB=1 and TWAB=0, then when a thermal warning disappears the Thermal Warning Post-Scale gain adjustment will remain until TWRB is changed to zero or the device is reset.

7.1.4 Thermal Warning Adjustment Bypass

BIT	R/W	RST	NAME	DESCRIPTION
6	R/W	1	TWAB	Thermal-Warning Adjustment Bypass: 0 – Thermal warning adjustment enabled 1 – Thermal warning adjustment disabled

The on-chip STA326 Power Output block provides feedback to the digital controller using inputs to the Power Control block. The TWARN input is used to indicate a thermal warning condition. When TWARN is asserted (set to 0) for a period greater than 400ms, the power control block will force an adjustment to the modulation limit in an attempt to eliminate the thermal warning condition. Once the thermal warning volume adjustment is applied, whether the gain is reapplied when TWARN is de-asserted is dependent on the TWRB bit.

7.1.5 Fault Detect Recovery Bypass

BIT	R/W	RST	NAME	DESCRIPTION
7	R/W	0	FDRB	Fault Detector Recovery Bypass: 0 – Fault Detector Recovery enabled 1 – Fault Detector Recovery disabled

The DDX Power block provides feedback to the digital controller using inputs to the Power Control block. The FAULT input is used to signal a fault condition (either over-current or thermal). When FAULT is asserted (set to 0), the power control block will attempt automatic recovery from the fault by asserting the tri-state signal in a sequence to reset the fault and retest the fault status. The sequence period can range from 0.1 milliseconds to 1 second as defined by the Fault-Detect Recovery Constant register (FDRC registers 29-2Ah). This sequence is repeated for as long as the fault condition exists. This feature is enabled by default but can be disabled by setting the FDRB control bit to 1. If Fault-Detect Recovery is disabled (not recommended), an output stage FAULT will cause a shut-down condition, which must be reset either by toggling the external reset pin or via a VCC power cycle to the IC.

7.2.1 Serial Audio Input Interface Format

BIT	R/W	RST	NAME	DESCRIPTION
3...0	R/W	0000	SAI (3...0)	Serial Audio Input Interface Format: Determines the interface format of the input serial digital audio interface.

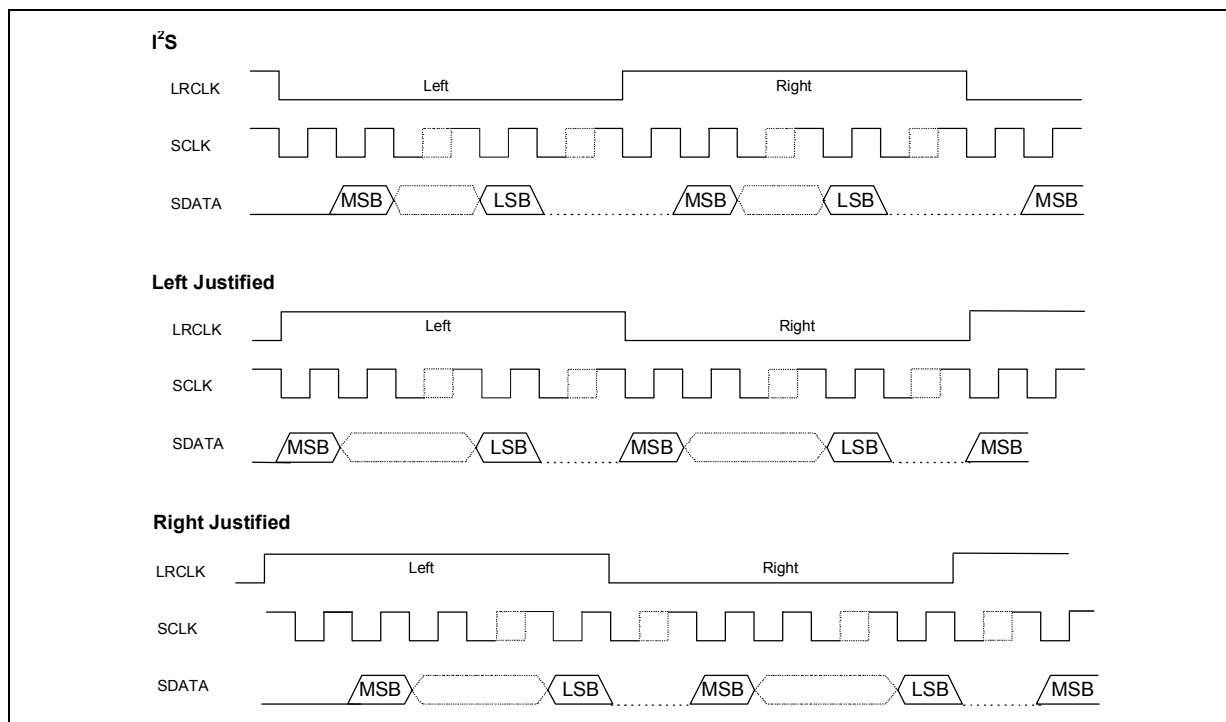

7.3 Serial Data Interface

The STA326 serial audio input was designed to interface with standard digital audio components and to accept a number of serial data formats. The STA326 always acts as a slave when receiving audio input from standard digital audio components. Serial data for two channels is provided using 3 input pins: left/right clock LRCLK (pin 33), serial clock BICKI (pin 31), and serial data 1 & 2 SDI12 (pin 32).

The SAI register (Configuration Register B - 01h, Bits D3-D0) and the SAIFB register (Configuration Register B - 01h, Bit D4) are used to specify the serial data format. The default serial data format is I2S, MSB-First. Available formats are shown in Figure 11 and the tables that follow.

Figure 11. General Serial Input and Output Formats

For example, SAI=1110 and SAIFB=1 would specify Right-Justified 16-bit data, LSB-First.

Table 10 below lists the serial audio input formats supported by STA326 as related to BICKI = 32/48/64fs, where the sampling rate fs = 32/44.1/48/88.2/96/176.4/192 kHz.

Table 9. First Bit Selection Table

SAIFB	Format
0	MSB-First
1	LSB-First

Note: Serial input and output formats are specified distinctly.

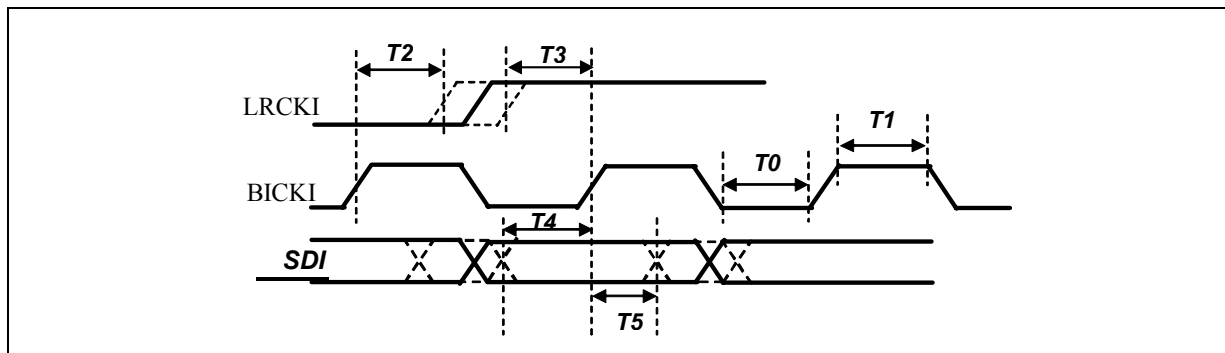

Table 10. Supported Serial Audio Input Formats

BICKI	SAI (3...0)	SAIFB	Interface Format
32fs	1100	X	I ² S 15bit Data
	1110	X	Left/Right-Justified 16bit Data

Figure 12.

7.3.1 Delay Serial Clock Enable

BIT	R/W	RST	NAME	DESCRIPTION
5	R/W	0	DSCKE	Delay Serial Clock Enable: 0 – No serial clock delay 1 – Serial clock delay by 1 core clock cycle to tolerate anomalies in some I ² S master devices

7.3.2 Channel Input Mapping

BIT	R/W	RST	NAME	DESCRIPTION
6	R/W	0	C1IM	0 – Processing channel 1 receives Left I ² S Input 1 – Processing channel 1 receives Right I ² S Input
7	R/W	1	C2IM	0 – Processing channel 2 receives Left I ² S Input 1 – Processing channel 2 receives Right I ² S Input

Each channel received via I²S can be mapped to any internal processing channel via the Channel Input Mapping registers. This allows for flexibility in processing. The default settings of these registers map each I²S input channel to its corresponding processing channel.

7.4 CONFIGURATION REGISTER C (Address 02h)

10000	16 Clock period Compensating Pulse Size
...	...
11111	31 Clock period Compensating Pulse Size

7.5 Configuration Register D (Address 03h)

D7	D6	D5	D4	D3	D2	D1	D0
MME	ZDE	DRC	BQL	PSL	DSPB	DEMP	HPB
0	0	0	0	0	0	0	0

7.5.1 High-Pass Filter Bypass

BIT	R/W	RST	NAME	DESCRIPTION
0	R/W	0	HPB	High-Pass Filter Bypass Bit. 0 – AC Coupling High Pass Filter Enabled 1 – AC Coupling High Pass Filter Disabled

The STA326 features an internal digital high-pass filter for the purpose of DC Blocking. The purpose of this filter is to prevent DC signals from passing through a DDX® amplifier. DC signals can cause speaker damage.

7.5.2 De-Emphasis

BIT	R/W	RST	NAME	DESCRIPTION
1	R/W	0	DEMP	De-emphasis: 0 – No De-emphasis 1 – De-emphasis

By setting this bit to HIGH, or one (1), de-emphasis will implemented on all channels. DSPB (DSP Bypass, Bit D2, CFA) bit must be set to 0 for De-emphasis to function.

7.5.3 DSP Bypass

BIT	R/W	RST	NAME	DESCRIPTION
2	R/W	0	DSPB	DSP Bypass Bit: 0 – Normal Operation 1 – Bypass of EQ and Mixing Functionality

Setting the DSPB bit bypasses all the EQ and Mixing functionality of the STA326 Core.

7.5.4 Post-Scale Link

BIT	R/W	RST	NAME	DESCRIPTION
3	R/W	0	PSL	Post-Scale Link: 0 – Each Channel uses individual Post-Scale value 1 – Each Channel uses Channel 1 Post-Scale value

Post-Scale functionality is an attenuation placed after the volume control and directly before the conversion to PWM. Post-Scale can also be used to limit the maximum modulation index and therefore the peak current. A setting of 1 in the PSL register will result in the use of the value stored in Channel 1 post-scale for all three internal channels.

7.5.5 Biquad Coefficient Link

BIT	R/W	RST	NAME	DESCRIPTION
4	R/W	0	BQL	Biquad Link: 0 – Each Channel uses coefficient values 1 – Each Channel uses Channel 1 coefficient values

For ease of use, all channels can use the biquad coefficients loaded into the Channel 1 Coefficient RAM space by setting the BQL bit to 1. Therefore, any EQ updates only have to be performed once.

7.5.6 Dynamic Range Compression/Anti-Clipping Bit

BIT	R/W	RST	NAME	DESCRIPTION
5	R/W	0	DRC	Dynamic Range Compression/Anti-Clipping 0 – Limiters act in Anti-Clipping Mode 1 – Limiters act in Dynamic Range Compression Mode

Both limiters can be used in one of two ways, anti-clipping or dynamic range compression. When used in anti-clipping mode the limiter threshold values are constant and dependent on the limiter settings. In dynamic range compression mode the limiter threshold values vary with the volume settings allowing a night-time listening mode that provides a reduction in the dynamic range regardless of the volume level.

7.5.7 Zero-Detect Mute Enable

BIT	R/W	RST	NAME	DESCRIPTION
6	R/W	1	ZDE	Zero-Detect Mute Enable: Setting of 1 enables the automatic zero-detect mute

Setting the ZDE bit enables the zero-detect automatic mute. When ZDE=1, the zero-detect circuit looks

at the input data to each processing channel after the channel-mapping block. If any channel receives 2048 consecutive zero value samples (regardless of fs) then that individual channel is muted if this function is enabled.

7.5.8 Sub-Mix Enable

BIT	R/W	RST	NAME	DESCRIPTION
7	R/W	0	SME	Sub-Mix Enable: 0 - Sub Mix into Left/Right Disabled 1 - Sub Mix into Left/Right Enabled

Setting the SME bit enables a scaled-mix of the content from the Sub channel (i.e. channel 3) into the main Left & Right channels (i.e. channels 1 & 2). The Sub-Mix resides post-volume & gain compression processing.

7.6 CONFIGURATION REGISTER E (ADDRESS 04H)

D7	D6	D5	D4	D3	D2	D1	D0
SVE	ZCE	RES	PWMS	AME	RES	MPC	MPCV
0	0	0	0	0	0	0	0

7.6.1 Max Power Correction Variable

BIT	R/W	RST	NAME	DESCRIPTION
0	R/W	0	MPCV	Max Power Correction Variable: 0 – Use Standard MPC Coefficient 1 – Use MPCC bits for MPC Coefficient

By enabling MPC and setting MPCV = 1, the max power correction becomes variable. By adjusting the MPCC registers (address 0x27-0x28) it becomes possible to adjust the THD at maximum unclipped power to a lower value for a particular application.

7.6.2 Max Power Correction

BIT	R/W	RST	NAME	DESCRIPTION
7	R/W	1	MPC	Max Power Correction: 0 – MPC Disabled 1 – MPC Enabled

Setting the MPC bit corrects the STA500/505/508 power device at high power. This mode will lower the THD+N of a full STA500 DDX[®] system at maximum power output and slightly below.

7.6.3 Noise Shaper BandWidth Selection

BIT	R/W	RST	NAME	DESCRIPTION
2	R/W	0	NSBW	Noise Shaper BandWidth Select 0 – 4 th Order Noise Shaper 1 – 3 rd Order Noise Shaper

DDXi-2101 provides the ability to the user to select two types of noise-shaper order. This facilitates the user to essentially make the appropriate bandwidth selection for their design thereby achieving optimal noise performance. It is recommended to set NSBW = '1' when the device is initialized via I²C.

7.6.4 AM Mode Enable

BIT	R/W	RST	NAME	DESCRIPTION
3	R/W	0	AME	AM Mode Enable: 0 – Normal DDX [®] operation. 1 – AM reduction mode DDX [®] operation.

The STA326 features a DDX[®] processing mode that minimizes the amount of noise generated in the frequency range of AM radio. This mode is intended for use when DDX[®] is operating in a device with an active AM tuner. The SNR of the DDX[®] processing is reduced to ~83dB in this mode, which is still greater than the SNR of AM radio.

7.6.5 PWM Speed Mode

BIT	R/W	RST	NAME	DESCRIPTION
4	R/W	0	PWMS	PWM Speed Selection: Normal or Odd

Table 14. PWM Output Speed Selections

PWMS (1...0)	PWM Output Speed
0	Normal Speed (384kHz) All Channels
1	Odd Speed (341.3kHz) All Channels

7.6.6 Zero-Crossing Volume Enable

BIT	R/W	RST	NAME	DESCRIPTION
6	R/W	1	ZCE	Zero-Crossing Volume Enable: 1 – Volume adjustments will only occur at digital zero-crossings 0 – Volume adjustments will occur immediately

The ZCE bit enables zero-crossing volume adjustments. When volume is adjusted on digital zero-crossings no clicks will be audible.

7.6.7 Soft Volume Update Enable

BIT	R/W	RST	NAME	DESCRIPTION
7	R/W	1	SVE	Soft Volume Enable: 1 – Volume adjustments will use soft volume 0 – Volume adjustments will occur immediately

The STA326 includes a soft volume algorithm that will step through the intermediate volume values at a predetermined rate when a volume change occurs. By setting SVE=0 this can be bypassed and volume changes will jump from old to new value directly. This feature is only available if individual channel volume bypass bit is set to '0'.

7.7.2 Invalid Input Detect Mute Enable

BIT	R/W	RST	NAME	DESCRIPTION
2	R/W	1	IDE	Invalid Input Detect Auto-Mute Enable: 0 – Disabled 1 – Enabled

Setting the IDE bit enables this function, which looks at the input I²S data and clocking and will automatically mute all outputs if the signals are perceived as invalid.

7.7.3 Binary Clock Loss Detection Enable

BIT	R/W	RST	NAME	DESCRIPTION
5	R/W	1	BCLE	Binary Output Mode Clock Loss Detection Enable 0 – Disabled 1 – Enabled

Detects loss of input MCLK in binary mode and will output 50% duty cycle to prevent audible artifacts when input clocking is lost.

7.7.4 Auto-EAPD on Clock Loss Enable

BIT	R/W	RST	NAME	DESCRIPTION
7	R/W	0	ECLE	Auto EAPD on Clock Loss 0 – Disabled 1 – Enabled

When ECLE is active, it issues a power device power down signal (EAPD) on clock loss detection.

7.7.5 Powerdown

BIT	R/W	RST	NAME	DESCRIPTION
6	R/W	1	PWDN	Software Power Down: 0 – Powerdown mode operation (auto soft-mute enabled) 1 – Normal Operation

If the powerdown bit is set low, a powerdown sequence is initiated resulting in a soft mute of all the channels and PWM outputs are damped.

7.7.6 External Amplifier Power Down

BIT	R/W	RST	NAME	DESCRIPTION
7	R/W	0	EAPD	External Amplifier Power Down: 0 – External Power Stage Power Down Active 1 – Normal Operation

EAPD is used to actively power down a connected DDX[®] Power device. This register has to be written to 1 at start-up to enable the DDX[®] power device for normal operation.

0	1	1	0	0	0	0	0

7.8.3 Volume Description

The volume structure of the STA326 consists of individual volume registers for each of the three channels and a master volume register, and individual channel volume trim registers. The channel volume settings

are normally used to set the maximum allowable digital gain and to hard-set gain differences between certain channels. These values are normally set at the initialization of the IC and not changed. The individual channel volumes are adjustable in 0.5dB steps from +48dB to -80 dB. The master volume control is normally mapped to the master volume of the system. The values of these two settings are summed to find the actual gain/volume value for any given channel.

When set to 1, the Master Mute will mute all channels, whereas the individual channel mutes (CxM) will mute only that channel. Both the Master Mute and the Channel Mutes provide a “soft mute” with the volume ramping down to mute in 4096 samples from the maximum volume setting at the internal processing rate (~96kHz). A “hard mute” can be obtained by commanding a value of all 1’s (FFh) to any channel volume register or the master volume register. When volume offsets are provided via the master volume register any channel whose total volume is less than -100dB will be muted.

All changes in volume take place at zero-crossings when ZCE = 1 (configuration register E) on a per channel basis as this creates the smoothest possible volume transitions. When ZCE=0, volume updates will occur immediately.

The STA326 also features a soft-volume update function that will ramp the volume between intermediate values when the value is updated, when SVE = 1 (configuration register E). This feature can be disabled by setting SVE = 0.

Each channel also contains an individual channel volume bypass. If a particular channel has volume bypassed via the CxVBP = 1 register then only the channel volume setting for that particular channel affects the volume setting, the master volume setting will not affect that channel. Also, master soft-mute will not affect the channel if CxVBP = 1.

Each channel also contains a channel mute. If CxM = 1 a soft mute is performed on that channel

Table 16. Master Volume Offset as a function of MV (7..0).

MV (7..0)	Volume Offset from Channel Value
00000000 (00h)	0dB
00000001 (01h)	-0.5dB
00000010 (02h)	-1dB

0	0	0	0	0	0	0	0

7.9.3.1 AutoMode AM Switching Enable

BIT	R/W	RST	NAME	DESCRIPTION
0	R/W	0	AMAME	AutoMode AM Enable 0 – Switching Frequency Determined by PWMS Setting 1 – Switching Frequency Determined by AMAM Settings
3...1	R/W	000	AMAM (2...0)	AM Switching Frequency Setting Default: 000

Table 21. AutoMode AM Switching Frequency Selection

AMAM (2..0)	48kHz/96kHz Input Fs	44.1kHz/88.2kHz Input Fs
000	0.535MHz – 0.720MHz	0.535MHz – 0.670Mhz
001	0.721MHz – 0.900MHz	0.671MHz – 0.800MHz
010	0.901MHz – 1.100MHz	0.801MHz – 1.000MHz
011	1.101MHz – 1.300MHz	1.001MHz – 1.180MHz
100	1.301MHz – 1.480MHz	1.181MHz – 1.340Mhz
101	1.481MHz – 1.600MHz	1.341MHz – 1.500MHz
110	1.601MHz – 1.700MHz	1.501MHz – 1.700MHz

When DDX[®] is used concurrently with an AM radio tuner, it is advisable to use the AMAM bits to automatically adjust the output PWM switching rate dependent upon the specific radio frequency that the tuner is receiving. The values used in AMAM are also dependent upon the sample rate determined by the ADC used.

7.9.3.2 AutoMode Crossover Setting

BIT	R/W	RST	NAME	DESCRIPTION
7...4	R/W	0	XO (3...0)	AutoMode Crossover Frequency Selection 000 – User Defined Crossover coefficients are used Otherwise – Preset coefficients for the crossover setting desired

The XO bits are used to either select one of the 15 preset crossover frequency settings or enable the user to implement custom crossover filters. The preset crossover settings signify the crossover frequency selected for the 2nd order low pass and 1st order high pass filters used on the processing channels. If a different crossover frequency, other than those available, is desired, then the user needs to set XO = 000 and design custom high-pass and low-pass filters. These filters should then be written to the device coefficient RAM using the I²C communication. Please refer to section 8.6.

C3OM1	C3OM0	C3LS1	C3LS0	C3BO	C3VBP		
0	0	0	0	0	0		

EQ control can be bypassed on a per channel basis. If EQ control is bypassed on a given channel the prescale and all 9 filters (high-pass, biquads, de-emphasis, bass management cross-over, bass, treble in any combination) are bypassed for that channel.

CxEQBP:

- 0 Perform EQ on Channel X – normal operation
- 1 Bypass EQ on Channel X

Tone control (bass/treble) can be bypassed on a per channel basis. If tone control is bypassed on a given channel the two filters that tone control utilizes are bypassed.

CxTCB:

- 0 Perform Tone Control on Channel x – (default operation)
- 1 Bypass Tone Control on Channel x

Each channel can be configured to output either the patented DDX PWM data or standart binary PWM encoded data. By setting the CxBO bit to ‘1’, each channel can be individually controlled to be in binary operation mode.

Also, there is the capability to map each channel independently onto any of the two limiters available within the STA326 or even not map it to any limiter at all (default mode).

Table 24. Channel Limiter Mapping Selection

CxLS (1,0)	Channel Limiter Mapping
00	Channel has limiting disabled
01	Channel is mapped to limiter #1
10	Channel is mapped to limiter #2

Each PWM Output Channel can receive data from any channel output of the volume block. Which channel a particular PWM output receives is dependent upon that channel’s CxOM register bits.

7.12.5 Dynamics Control Description

The STA326 includes 2 independent limiter blocks. The purpose of the limiters is to automatically reduce the dynamic range of a recording to prevent the outputs from clipping in anti-clipping mode, or to actively reduce the dynamic range for a better listening environment (such as a night-time listening mode, which is often needed for DVDs.) The two modes are selected via the DRC bit in Configuration Register D, bit 5 address 0x03. Each channel can be mapped to Limiter1, Limiter2, or not mapped.

If a channel is not mapped, that channel will clip normally when 0 dB FS is exceeded. Each limiter will look at the present value of each channel that is mapped to it, select the maximum absolute value of all these channels, perform the limiting algorithm on that value, and then if needed adjust the gain of the mapped channels in unison.

The limiter attack thresholds are determined by the LxAT registers. When the Attack Thesehold has been exceeded, the limiter, when active, will automatically start reducing the gain. The rate at which the gain is reduced when the attack threshold is exceeded is dependent upon the attack rate register setting for that limiter. The gain reduction occurs on a peak-detect algorithm.

The release of limiter, when the gain is again increased, is dependent on a RMS-detect algorithm. The output of the volume/limiter block is passed through an RMS filter. The output of this filter is compared to the release threshold, determined by the Release Threshold register.

When the RMS filter output falls below the release threshold, the gain is increased at a rate dependent upon the Release Rate register. The gain can never be increased past its set value and therefore the release will only occur if the limiter has already reduced the gain. The release threshold value can be used to set what is effectively a minimum dynamic range. This is helpful as over-limiting can reduce the dynamic range to virtually zero and cause program material to sound “lifeless”.

In AC mode the attack and release thresholds are set relative to full-scale. In DRC mode the attack threshold is set relative to the maximum volume setting of the channels mapped to that limiter and the release threshold is set relative to the maximum volume setting plus the attack threshold.

8 USER PROGRAMMABLE PROCESSING

8.1 EQ - BIQUAD EQUATION

The biquads use the equation that follows. This is diagrammed in Figure 14 below.

$$Y[n] = 2(b_0/2)X[n] + 2(b_1/2)X[n-1] + b_2X[n-2] - 2(a_1/2)Y[n-1] - a_2Y[n-2]$$

$$= b_0X[n] + b_1X[n-1] + b_2X[n-2] - a_1Y[n-1] - a_2Y[n-2]$$

where $Y[n]$ represents the output and $X[n]$ represents the input. Multipliers are 28-bit signed fractional multipliers, with coefficient values in the range of 800000h (-1) to 7FFFFFFh (0.9999998808).

Coefficients stored in the User Defined Coefficient RAM are referenced in the following manner:

- CxHy0 = $b_1/2$
- CxHy1 = b_2
- CxHy2 = $-a_1/2$
- CxHy3 = $-a_2$
- CxHy4 = $b_0/2$

The x represents the channel and the y the biquad number. For example C3H41 is the $b_0/2$ coefficient in the fourth biquad for channel 3

Figure 14. - Biquad Filter

8.2 PRE-SCALE

The Pre-Scale block which precedes the first biquad is used for attenuation when filters are designed that boost frequencies above 0dBFS. This is a single 28-bit signed multiplier, with 800000h = -1 and 7FFFFFFh = 0.9999998808. By default, all pre-scale factors are set to 7FFFFFFh.

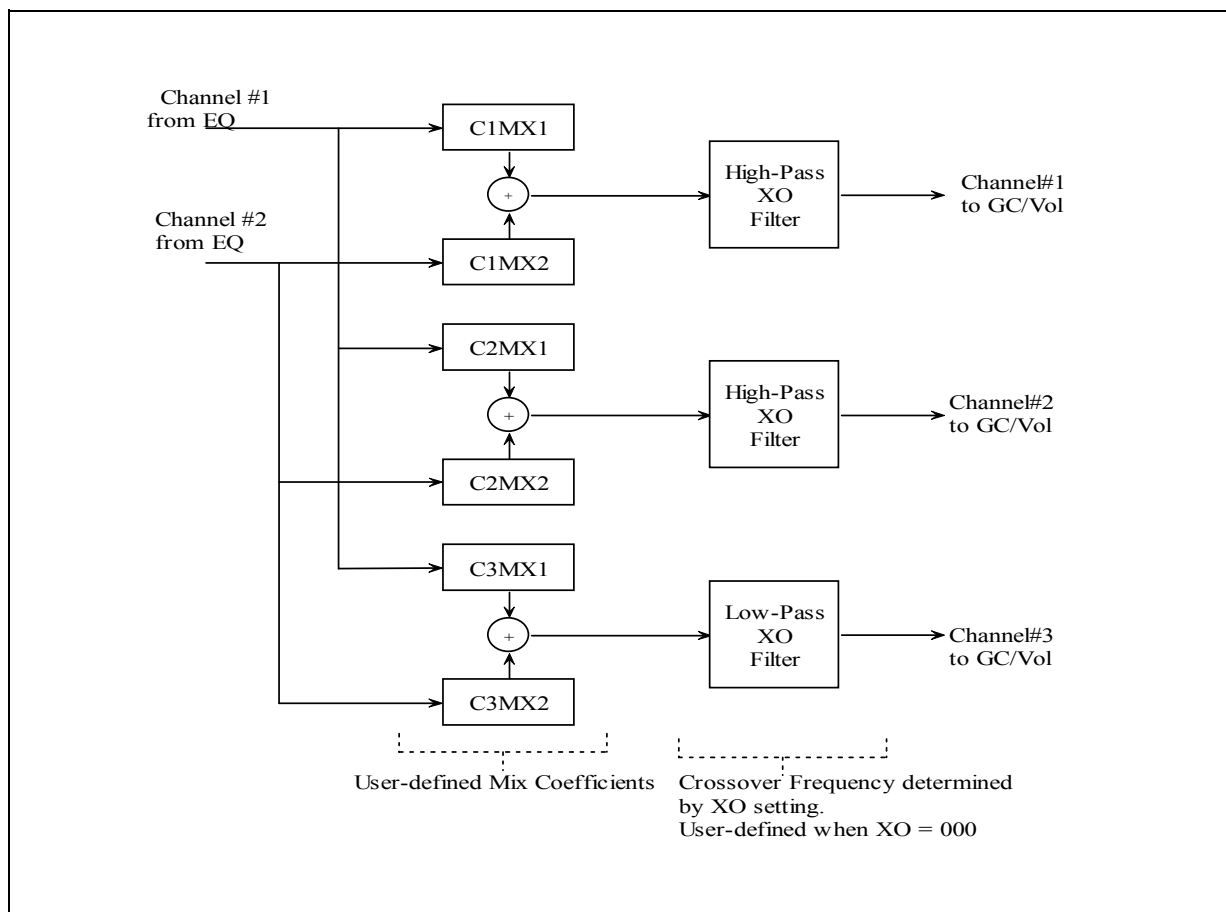

8.3 POST-SCALE

The STA326 provides one additional multiplication after the last interpolation stage and before the distortion compensation on each channel. This is a 24-bit signed fractional multiplier. The scale factor for this multiplier is loaded into RAM using the same I2C registers as the biquad coefficients and the mix. All channels can use the same settings as channel 1 by setting the post-scale link bit.

8.4 MIX/BASS MANAGEMENT

The STA326 provides a post-EQ mixing block per channel. Each channel has 2 mixing coefficients, which are each 24-bit signed fractional multipliers, that correspond to the 2 channels of input to the mixing block. These coefficients are accessible via the User Controlled Coefficient RAM described below. The mix coefficients are expressed as 24-bit signed; fractional numbers in the range +1.0 (8388607) to -1.0 (-8388608) are used to provide three channels of output from two channels of filtered input.

Table 33. Mix/Bass Management Block Diagram

After a mix is achieved, STA326 also provides the capability to implement crossover filters on all channels corresponding to 2.1 bass management solution. Channels 1-2 use a 1st order high-pass filter and channel 3 uses a 2nd order low-pass filter corresponding to the setting of the XO bits of I2C register 0Ch. If XO = 000, user specified crossover filters are used.

By default these coefficients correspond to pass-through. However, the user can write these coefficients in a similar way as the EQ biquads. When user-defined setting is selected, the user can only write 2nd order crossover filters. This output is then passed on to the Volume/Limiter block.

8.5 Calculating 24-Bit Signed Fractional Numbers from a dB Value

The pre-scale, mixing, and post-scale functions of the STA326 use 24-bit signed fractional multipliers to attenuate signals. These attenuations can also invert the phase and therefore range in value from -1 to +1. It is possible to calculate the coefficient to utilize for a given negative dB value (attenuation) via the equations below.

- Non-Inverting Phase Numbers 0 to +1 :
- Coefficient = Round(8388607 * 10^(dB/20))
- Inverting Phase Numbers 0 to -1 :
- Coefficient = 16777216 - Round(8388607 * 10^(dB/20))

As can be seen by the preceding equations, the value for positive phase 0dB is 0x7FFFFFFF and the value for negative phase 0dB is 0x800000.

Coefficients for EQ, Mix and Scaling are handled internally in the STA326 via RAM. Access to this RAM is available to the user via an I²C register interface. A collection of I²C registers are dedicated to this function. First register contains the coefficient base address, five sets of three registers store the values of the 24-bit coefficients to be written or that were read, and one contains bits used to control the read or write of the coefficient (s) to RAM. The following are instructions for reading and writing coefficients.

8.7 Reading a coefficient from RAM

- write 8-bits of address to I²C register 16h
- write '1' to bit R1 (D2) of I²C register 26h
- read top 8-bits of coefficient in I²C address 17h
- read middle 8-bits of coefficient in I²C address 18h
- read bottom 8-bits of coefficient in I²C address 19h

8.8 Reading a set of coefficients from RAM

- write 8-bits of address to I²C register 16h
- write '1' to bit RA (D3) of I²C register 26h
- read top 8-bits of coefficient in I²C address 17h
- read middle 8-bits of coefficient in I²C address 18h
- read bottom 8-bits of coefficient in I²C address 19h
- read top 8-bits of coefficient b2 in I²C address 1Ah
- read middle 8-bits of coefficient b2 in I²C address 1Bh
- read bottom 8-bits of coefficient b2 in I²C address 1Ch
- read top 8-bits of coefficient a1 in I²C address 1Dh
- read middle 8-bits of coefficient a1 in I²C address 1Eh
- read bottom 8-bits of coefficient a1 in I²C address 1Fh
- read top 8-bits of coefficient a2 in I²C address 20h
- read middle 8-bits of coefficient a2 in I²C address 21h
- read bottom 8-bits of coefficient a2 in I²C address 22h
- read top 8-bits of coefficient b0 in I²C address 23h
- read middle 8-bits of coefficient b0 in I²C address 24h
- read bottom 8-bits of coefficient b0 in I²C address 25h

8.9 Writing a single coefficient to RAM

- write 8-bits of address to I²C register 16h
- write top 8-bits of coefficient in I²C address 17h
- write middle 8-bits of coefficient in I²C address 18h
- write bottom 8-bits of coefficient in I²C address 19h
- write 1 to W1 bit in I²C address 26h

8.10 Writing a set of coefficients to RAM

- write 8-bits of starting address to I²C register 16h
- write top 8-bits of coefficient b1 in I²C address 17h
- write middle 8-bits of coefficient b1 in I²C address 18h
- write bottom 8-bits of coefficient b1 in I²C address 19h
- write top 8-bits of coefficient b2 in I²C address 1Ah
- write middle 8-bits of coefficient b2 in I²C address 1Bh
- write bottom 8-bits of coefficient b2 in I²C address 1Ch
- write top 8-bits of coefficient a1 in I²C address 1Dh
- write middle 8-bits of coefficient a1 in I²C address 1Eh
- write bottom 8-bits of coefficient a1 in I²C address 1Fh
- write top 8-bits of coefficient a2 in I²C address 20h
- write middle 8-bits of coefficient a2 in I²C address 21h
- write bottom 8-bits of coefficient a2 in I²C address 22h
- write top 8-bits of coefficient b0 in I²C address 23h
- write middle 8-bits of coefficient b0 in I²C address 24h
- write bottom 8-bits of coefficient b0 in I²C address 25h
- write 1 to WA bit in I²C address 26h

The mechanism for writing a set of coefficients to RAM provides a method of updating the five coefficients corresponding to a given biquad (filter) simultaneously to avoid possible unpleasant acoustic side-effects. When using this technique, the 8-bit address would specify the address of the biquad b1 coefficient (e.g. 0, 5, 10, 15, ..., 45 decimal), and the STA326 will generate the RAM addresses as offsets from this base value to write the complete set of coefficient data.

Table 34. RAM Block for Biquads, Mixing, and Scaling

Index (Decimal)	Index (Hex)		Coefficient	Default
0	00h	Channel 1 – Biquad 1	C1H10 (b1/2)	000000h
1	01h		C1H11 (b2)	000000h
2	02h		C1H12 (a1/2)	000000h
3	03h		C1H13 (a2)	000000h
4	04h		C1H14 (b0/2)	400000h
5	05h	Channel 1 – Biquad 2	C1H20	000000h
...
19	13h	Channel 1 – Biquad 4	C1H44	400000h
20	14h	Channel 2 – Biquad 1	C2H10	000000h
21	15h		C2H11	000000h
...
39	27h	Channel 2 – Biquad 4	C2H44	400000h
40	28h	High-Pass 2 nd Order Filter For XO = 000	C12H0 (b1/2)	000000h
41	29h		C12H1 (b2)	000000h
42	2Ah		C12H2 (a1/2)	000000h
43	2Bh		C12H3 (a2)	000000h
44	2Ch		C12H4 (b0/2)	400000h
45	2Dh	Low-Pass 2 nd Order Filter For XO = 000	C12L0 (b1/2)	000000h
46	2Eh		C12L1 (b2)	000000h
47	2Fh		C12L2 (a1/2)	000000h
48	30h		C12L3 (a2)	000000h
49	31h		C12L4 (b0/2)	400000h
50	32h	Channel 1 – Pre-Scale	C1PreS	7FFFFFFh
51	33h	Channel 2 – Pre-Scale	C2PreS	7FFFFFFh
52	34h	Channel 1 – Post-Scale	C1PstS	7FFFFFFh
53	35h	Channel 2 – Post-Scale	C2PstS	7FFFFFFh
54	36h	Channel 3 – Post-Scale	C3PstS	7FFFFFFh
55	37h	Thermal Warning – Post Scale	TWPstS	5A9DF7h
56	38h	Channel 1 – Mix 1	C1MX1	7FFFFFFh
57	39h	Channel 1 – Mix 2	C1MX2	000000h
58	3Ah	Channel 2 – Mix 1	C2MX1	000000h
59	3Bh	Channel 2 – Mix 2	C2MX2	7FFFFFFh
60	3Ch	Channel 3 – Mix 1	C3MX1	400000h
61	3Dh	Channel 3 – Mix 2	C3MX2	400000h
62	3Eh	UNUSED		
63	3Fh	UNUSED		

8.11 Variable Max Power Correction (Address 27h-28h):

MPCC bits determine the 16 MSBs of the MPC compensation coefficient. This coefficient is used in place of the default coefficient when MPCV = 1.

D7	D6	D5	D4	D3	D2	D1	D0
MPCC15	MPCC14	MPCC13	MPCC12	MPCC11	MPCC10	MPCC9	MPCC8
0	0	1	0	1	1	0	1
MPCC7	MPCC6	MPCC5	MPCC4	MPCC3	MPCC2	MPCC1	MPCC0
1	1	0	0	0	0	0	0

8.12 Fault Detect Recovery (Address 2Bh-2Ch):

FDRC bits specify the 16-bit Fault Detect Recovery time delay. When FAULT is asserted, the TRISTATE output will be immediately asserted low and held low for the time period specified by this constant. A constant value of 0001h in this register is ~.083ms. The default value of 000C specifies ~.1mSec.

Date	Revision	Description of Changes
July 2005	1	First Issue
May 2006	2	Changed from preliminary data to maturity.

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED REPRESENTATIVE OF ST, ST PRODUCTS ARE NOT DESIGNED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS, WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
