

## 1. Overview

### 1.1 Features

The M16C Family offers a robust platform of 32-/16-bit CISC microcomputers (MCUs) featuring high ROM code efficiency, extensive EMI/EMS noise immunity, ultra-low power consumption, high-speed processing in actual applications, and numerous and varied integrated peripherals. Extensive device scalability from low- to high-end, featuring a single architecture as well as compatible pin assignments and peripheral functions, provides support for a vast range of application fields.

The R32C/100 Series is a high-end microcontroller series in the M16C Family. With a 4-Gbyte memory space, it achieves maximum code efficiency and high-speed processing with 32-bit CISC architecture, multiplier, multiply-accumulate unit, and floating point unit. The selection from the broadest choice of on-chip peripheral devices — UART, CRC, DMAC, A/D and D/A converters, timers, I<sup>2</sup>C, and WDT enables to minimize external components.

The R32C/100 Series, in particular, provides the R32C/121 Group, a product specific to vehicle network. This product, provided as 100-pin plastic molded LQFP package, configures two channels of CAN, two channels of LIN, and standard peripherals.

#### 1.1.1 Applications

Automotive, audio, communication equipment, industrial equipment etc.

## 2. Central Processing Unit (CPU)

Figure 2.1 shows the CPU registers. Ten specific of these registers (R2R0, R3R1, R6R4, R7R5, A0, A1, A2, A3, SB, and FB) configure two sets of register banks.

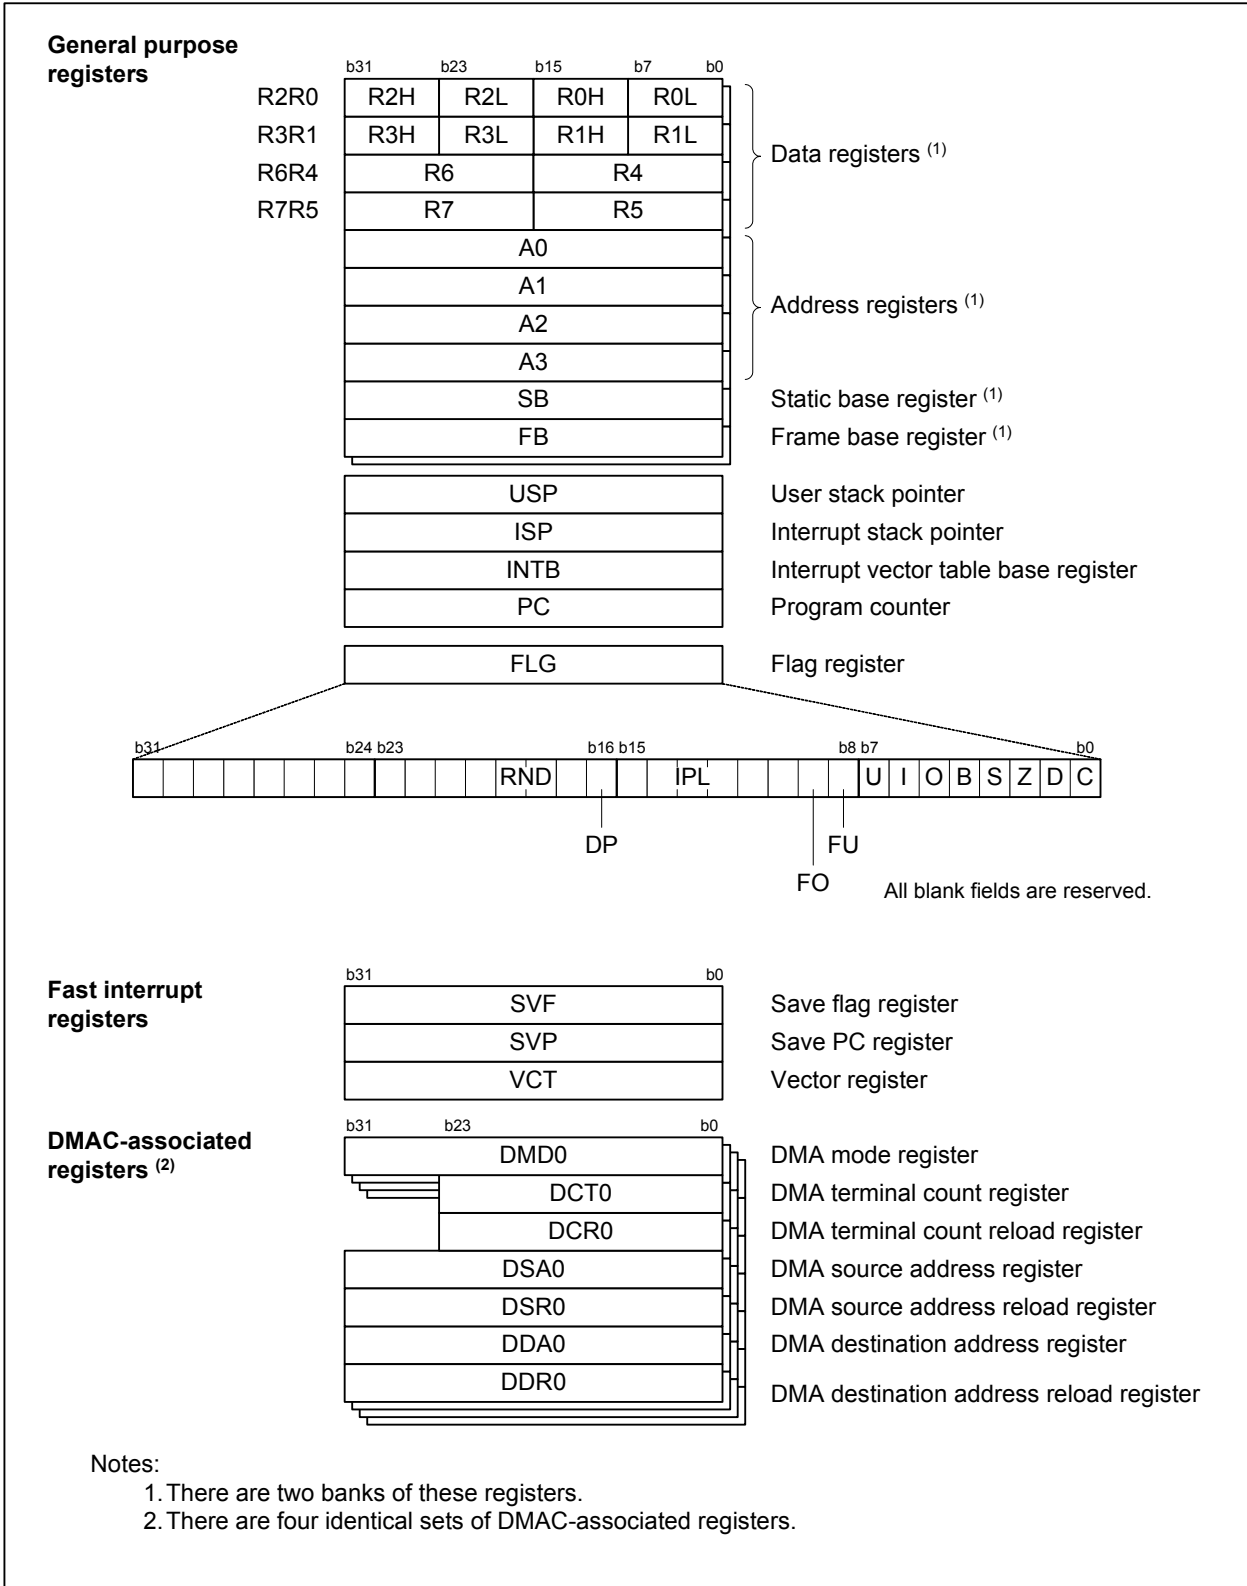

Figure 2.1 CPU Registers

## 2.1 General Purpose Registers

### 2.1.1 Data Registers (R2R0, R3R1, R6R4, and R7R5)

These 32-bit registers are primarily used for transfers and arithmetic/logic operations.

Each of the registers can be divided into the upper and the lower 16-bit registers, e.g. R2R0 can be divided into R2 and R0, R3R0 can be divided into R3 and R1, etc.

Moreover, data registers R2R0 and R3R1 can be divided into four 8-bit data registers: the upper (R2h, and R3H), the mid-upper (R2L, and R3L), the mid-lower (R0H, and R1H), and the lower (R0L, and R1L).

### 2.1.2 Address Registers (A0, A1, A2, and A3)

These 32-bit registers have the similar functions to the data registers. They are also used for address register indirect addressing and address register relative addressing.

### 2.1.3 Static Base Register (SB)

This 32-bit register is used for SB relative addressing.

### 2.1.4 Frame Base Register (FB)

This 32-bit register is used for FB relative addressing.

### 2.1.5 Program Counter (PC)

This 32-bit counter indicates the address of the instruction to be executed next.

### 2.1.6 Interrupt Vector Table Base Register (INTB)

This 32-bit register indicates the start address of a relocatable vector table.

### 2.1.7 User Stack Pointer (USP) and Interrupt Stack Pointer (ISP)

Two types of 32-bit stack pointers (SPs) are provided: user stack pointer (USP) and interrupt stack pointer (ISP). They are switched by the U flag. Refer to 2.1.8 “Flag Register (FLG)” for details on the U flag.

The stack pointer (USP/ISP) to be used can be switched by the stack pointer select flag (U flag). This flag is bit 7 in the flag register (FLG).

A multiple of 4 should be set to USP or ISP, which enables faster interrupt sequence due to less memory access.

### 2.1.8 Flag Register (FLG)

This 32-bit register indicates the CPU status.

#### 2.1.8.1 Carry Flag (C flag)

This flag has the carry, borrow, shifted-out bit, etc. generated in the arithmetic logic unit (ALU).

#### 2.1.8.2 Debug Flag (D flag)

This flag is used exclusively for debugging. Only set this bit to 0.

#### 2.1.8.3 Zero Flag (Z flag)

This flag becomes 1 when an operation results in 0; in all other cases, this flag becomes 0.

#### 2.1.8.4 Sign Flag (S flag)

This flag becomes 1 when an operation results in a negative; in all other cases, this flag becomes 0.

### 2.1.8.5 Register Bank Select Flag (B flag)

This flag selects a register bank. It indicates 0 when the register bank 0 is selected, and 1 when the register bank 1 is selected.

### 2.1.8.6 Overflow Flag (O flag)

This flag becomes 1 if an operation results in an overflow; in all other cases, this flag becomes 0.

### 2.1.8.7 Interrupt Enable Flag (I flag)

This flag enables a maskable interrupt. It indicates 0 when an interrupt is disabled, and 1 when an interrupt is enabled. Once an interrupt is accepted, the flag is set to 0.

### 2.1.8.8 Stack Pointer Select Flag (U flag)

This flag indicates 0 when the interrupt stack pointer (ISP) is selected, and 1 when the user stack pointer (USP) is selected.

It is set to 0 when a hardware interrupt is accepted or the INT instruction whose software interrupt number is 0 to 127 is executed.

### 2.1.8.9 Floating-point Underflow Flag (FU flag)

This flag becomes 1 if a floating point operation results in an underflow; in all other cases, this flag becomes 0. It also becomes 1 when the operand has invalid numbers (subnormal numbers).

### 2.1.8.10 Floating-point Overflow Flag (FO flag)

This flag becomes 1 if a floating point operation results in an overflow; in all other cases, this flag becomes 0. It also becomes 1 when the operand has invalid numbers (subnormal numbers).

### 2.1.8.11 Processor Interrupt Priority Level (IPL)

The 3-bit processor interrupt priority level (IPL) specifies eight processor interrupt priority levels from 0 to 7. If a requested interrupt's priority level is higher than the processor interrupt priority level (IPL), this interrupt is enabled.

If the processor interrupt priority level (IPL) is set to 111b (level 7), any interrupt is disabled.

### 2.1.8.12 Fixed-point Designation Bit (DP bit)

This bit designates a fixed point. It also designates which part of the multiplication result should be taken. It is used for MULX instruction.

### 2.1.8.13 Floating-point Rounding Mode (RND)

The 2-bit floating point rounding mode designates a rounding mode for the operation result.

### 2.1.8.14 Reserved

The fields are written with 0. The read value is undefined.

## 2.2 Fast Interrupt Registers

These registers are exclusively used to achieve high performance of interrupt sequence. Three types of register are shown as below.

### 2.2.1 Save Flag Register (SVF)

This 32-bit register is used to save the flag register when a fast interrupt is generated.

### 2.2.2 Save PC Register (SVP)

This 32-bit register is used to save the program counter when a fast interrupt is generated.

### 2.2.3 Vector Register (VCT)

This 32-bit register is used to indicate a jump address when a fast interrupt is generated.

## 2.3 DMAC-associated Registers

Seven types of register are shown as below.

### 2.3.1 DMA Mode Registers (DMD0, DMD1, DMD2, and DMD3)

These 32-bit registers are used to set DMA transfer mode, bit rate etc.

### 2.3.2 DMA Terminal Count Registers (DCT0, DCT1, DCT2, and DCT3)

These 24-bit registers are used to set DMA transfer counting.

### 2.3.3 DMA Terminal Count Reload Registers (DCR0, DCR1, DCR2, and DCR3)

These 32-bit registers are used to set the reloaded value for DMA destination address register.

### 3. Memory

Figure 3.1 shows a memory mapping of the R32C/121 Group.

The R32C/121 Group provides 4-Gbyte address space from 00000000h to FFFFFFFFh.

The internal ROM is allocated from address FFFFFFFFh down. For example, a 512-Kbyte internal ROM is addressed from FFF80000h to FFFFFFFFh.

The fixed interrupt vectors are allocated from address FFFFFFFDCh to FFFFFFFFh in which the starting address of each interrupt handler is stored.

The internal RAM is allocated from address 00000400h up. For example, a 32-Kbyte internal RAM is addressed from 00000400h to 000083FFh. Besides being used for data storage, the internal RAM functions as stack(s) for a subroutine and/or an interrupt handler.

Special Function Registers (SFRs), consisting of control registers for peripheral functions, are allocated from address 00000000h to 00003FFFh and from 00040000h to 0004FFFFh. Any blank spaces within the SFRs are reserved. No access is allowed.

Notes:

1. Program/erase definition  
 This value represents the number of erasures per block.  
 If the flash memory is programmed/erased n times, each block can be erased n times.  
 i.e. If 4-word write is performed in 512 different addresses in the block A of 4 Kbyte and then the block is erased, it is considered the programming/erasure is performed just once.  
 However a write in the same address more than once for one erasure is disabled. (overwrite disabled).
2. The data retention time includes the periods when the supply voltage is not applied and no clock is provided.
3. This data retention includes 3000 hours in  $T_a = 125^\circ\text{C}$  and 7000 hours in  $T_a = 85^\circ\text{C}$ .
4. Please contact a Renesas sales office regarding data retention time other than the above.

## 1. Program/erase definition

This value represents the number of erasure per block.

If the flash memory is programmed/erased n times, each block can be erased n times.

i.e. If a word write is performed in different 16 addresses in a block and then the block is erased, it is considered the programming/erasure is performed just once. However a write in the same address more than once for one erasure is disabled. (overwrite disabled).

## 2. The data retention time includes the periods when the supply voltage is not applied and no clock is provided.

3. This data retention includes the following 10000 hours: 3000 hours in T<sub>a</sub> = 125°C and 7000 hours in T<sub>a</sub> = 85°C.
