

16-Channel Buffered CMOS Logic-Level Translators

General Description

The MAX13101E/MAX13102E/MAX13103E/MAX13108E 16-bit bidirectional CMOS logic-level translators provide the level shifting necessary to allow data transfer in multivoltage systems. These devices are inherently bidirectional due to their design and do not require the use of a direction input. Externally applied voltages, V_{CC} and V_L , set the logic levels on either side of the devices. Logic signals present on the V_L side of the device appear as a higher voltage logic signal on the V_{CC} side of the device, and vice-versa.

The MAX13101E/MAX13102E/MAX13103E feature an enable input (EN) that, when low, reduces the V_{CC} and V_L supply currents to less than $2\mu\text{A}$. The MAX13108E features a multiplexing input (MULT) that selects one byte between the two, thus allowing multiplexing of the signals. The MAX13101E/MAX13102E/MAX13103E/MAX13108E have $\pm 15\text{kV}$ ESD protection on the I/O V_{CC} side for greater protection in applications that route signals externally. Three different output configurations are available during shutdown, allowing the I/O on the V_{CC} side or the V_L side to be put in a high-impedance state or pulled to ground through an internal $6\text{k}\Omega$ resistor.

The MAX13101E/MAX13102E/MAX13103E/MAX13108E accept V_{CC} voltages from $+1.65\text{V}$ to $+5.5\text{V}$ and V_L voltages from $+1.2\text{V}$ to V_{CC} , making them ideal for data transfer between low-voltage ASICs/PLDs and higher voltage systems. The MAX13101E/MAX13102E/MAX13103E/MAX13108E are available in 36-bump WLP and 40-pin TQFN packages, and operate over the extended -40°C to $+85^\circ\text{C}$ temperature range.

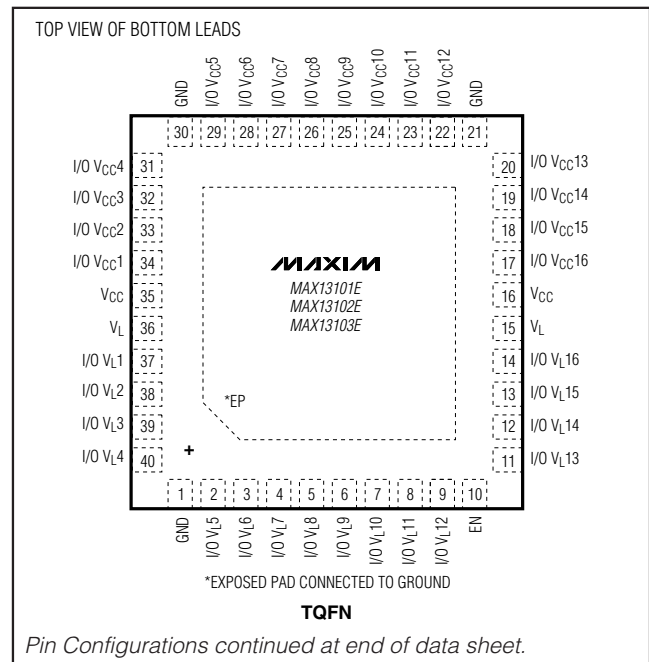

Applications

CMOS Logic-Level Translation	PDA's
Portable Equipment	Digital Still Cameras
Cell Phones	Smart Phones

Features

- ◆ Wide Supply Voltage Range
 V_{CC} Range of 1.65V to 5.5V
 V_L Range of 1.2V to V_{CC}
- ◆ ESD Protection on I/O V_{CC} Lines
 $\pm 15\text{kV}$ Human Body Model
- ◆ Up to 20Mbps Throughput
- ◆ Low $0.03\mu\text{A}$ Typical Quiescent Current
- ◆ WLP and TQFN Packages

Pin Configurations

Ordering Information/Selector Guide

PART	PIN-PACKAGE	DATA RATE (Mbps)	I/O V_L STATE DURING SHUTDOWN	I/O V_{CC} STATE DURING SHUTDOWN	MULTIPLEXER FEATURE
MAX13101EEWX+*	36 WLP** 3.06mm x 3.06mm	20	High impedance	$6\text{k}\Omega$ to GND	No
MAX13101EETL+	40 TQFN-EP*** 5mm x 5mm x 0.8mm	20	High impedance	$6\text{k}\Omega$ to GND	No

Note: All devices are specified over the -40°C to $+85^\circ\text{C}$ operating temperature range.

+Denotes a lead-free/RoHS-compliant package.

*Future product—contact factory for availability.

**WLP bumps are in a 6×6 array.

***EP = Exposed pad.

Ordering Information/Selector Guide continued at end of data sheet.

16-Channel Buffered CMOS Logic-Level Translators

ABSOLUTE MAXIMUM RATINGS

(All voltages referenced to GND.)

V _{CC}	-0.3V to +6V
V _L	-0.3V to +6V
I/O V _{CC} _.....	-0.3V to (V _{CC} + 0.3V)
I/O V _L _.....	-0.3V to (V _L + 0.3V)
EN, MULT.....	-0.3V to +6V
Short-Circuit Duration I/O V _L _, I/O V _{CC} _ to GND.....	Continuous
Continuous Power Dissipation (T _A = +70°C)	
36-Bump WLP (derate 17.0mW/°C above +70°C).....	1361mW
40-Pin TQFN (derate 35.7mW/°C above +70°C).....	2857mW

Operating Temperature Range.....	-40°C to +85°C
Maximum Junction Temperature.....	+150°C
Storage Temperature Range.....	-65°C to +150°C
Lead Temperature (soldering, 10s).....	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = +1.65V to +5.5V, V_L = +1.2V to V_{CC}, EN = V_L (MAX13101E/MAX13102E/MAX13103E), MULT = V_L or GND (MAX13108E), T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at V_{CC} = +1.65V, V_L = +1.2V, T_A = +25°C.) (Notes 1, 2)

Propagation Delay (Driving I/O V_{CC} _)	$t_{PVCC-VL}$	$R_S = 50\Omega$, $C_{I/OVL_} = 15pF$, $t_{RISE} \leq 3ns$, (Figures 2a, 2b)			20	ns
Channel-to-Channel Skew	t_{SKEW}	$R_S = 50\Omega$, $C_{I/OVCC_} = 50pF$, $C_{I/OVL_} = 15pF$, $t_{RISE} \leq 3ns$			5	ns
Part-to-Part Skew	t_{PPSKEW}	$R_S = 50\Omega$, $C_{I/OVCC_} = 50pF$, $C_{I/OVL_} = 15pF$, $t_{RISE} \leq 3ns$, $\Delta T_A = +20^\circ C$ (Notes 3, 4)			10	ns
Propagation Delay from I/O V_L _ to I/O V_{CC} _ After EN	t_{EN-VCC}	$C_{I/OVCC_} = 50pF$ (Figure 3)			1	μs
Propagation Delay from I/O V_{CC} _ to I/O V_L _ After EN	t_{EN-VL}	$C_{I/OVL_} = 15pF$ (Figure 4)			1	μs
Maximum Data Rate		$R_{SOURCE} = 50\Omega$, $C_{I/OVCC_} = 50pF$, $C_{I/OVL_} = 15pF$, $t_{RISE} \leq 3ns$	20			Mbps

Note 1: All units are 100% production tested at $T_A = +25^\circ C$. Limits over the operating temperature range are guaranteed by design and not production tested.

Note 2: For normal operation, ensure that $V_L < (V_{CC} + 0.3V)$. During power-up, $V_L > (V_{CC} + 0.3V)$ does not damage the device.

Note 3: V_{CC} from device 1 must equal V_{CC} of device 2. V_L from device 1 must equal V_L of device 2.

Note 4: Guaranteed by design, not production tested.

Functional Diagrams

16-Channel Buffered CMOS Logic-Level Translators

MAX13101E/MAX13102E/MAX13103E/MAX13108E

Detailed Description

The MAX13101E/MAX13102E/MAX13103E/MAX13108E logic-level translators provide the level shifting necessary to allow data transfer in a multivoltage system. Externally applied voltages, V_{CC} and V_L , set the logic levels on either side of the device. Logic signals present on the V_L side of the device appear as a higher voltage logic signal on the V_{CC} side of the device, and vice-versa. The MAX13101E/MAX13102E/MAX13103E/MAX13108E are bidirectional level translators allowing data translation in either direction ($V_L \leftrightarrow V_{CC}$) on any single data line. The MAX13101E/MAX13102E/MAX13103E/MAX13108E accept V_L from +1.2V to V_{CC} . All devices have a V_{CC} range from +1.65V to +5.5V, making them ideal for data transfer between low-voltage ASICs/PLDs and higher voltage systems.

The MAX13101E/MAX13102E/MAX13103E feature an output enable mode that reduces V_{CC} supply current to less than 1 μ A, and V_L supply current to less than 2 μ A when in shutdown. The MAX13108E features a multiplexing input that selects one byte between the two, thus allowing multiplexing of the signals. The MAX13101E/MAX13102E/MAX13103E/MAX13108E have ± 15 kV ESD protection on the I/O V_{CC} side for greater protection in applications that route signals externally. The MAX13101E/MAX13102E/MAX13103E/MAX13108E operate at a guaranteed data rate of 20Mbps. The maximum data rate depends heavily on the load capacitance (see the *Typical Operating Characteristics*) and the output impedance of the external driver.

Power-Supply Sequencing

For proper operation, ensure that $+1.65\text{V} \leq V_{CC} \leq +5.5\text{V}$, $+1.2\text{V} \leq V_L \leq +5.5\text{V}$, and $V_L \leq V_{CC}$. During power-up sequencing, $V_L \geq V_{CC}$ does not damage the device. When V_{CC} is disconnected and V_L is powering up, up to 10mA of current can be sourced to each load on the V_L side, yet the device does not latch up. To guarantee that no excess leakage current flows and that the device does not interfere with the I/O on the V_L side, V_{CC} should be connected to GND with a max 50 Ω resistor when the V_{CC} supply is not present (Figure 5).

Input Driver Requirements

The MAX13101E/MAX13102E/MAX13103E/MAX13108E architecture is based on a one-shot accelerator output stage (Figure 6). Accelerator output stages are always in tri-state except when there is a transition on any of the translators on the input side, either I/O $V_{L_}$ or I/O $V_{CC_}$. Then a short pulse is generated, during which the accelerator output stages become active and charge/discharge the capacitances at the I/Os. Due to

Figure 5. Recommended Circuit for Powering Down V_{CC}

the bidirectional nature, both input stages become active during the one-shot pulse. This can lead to some current feeding into the external source that is driving the translator. However, this behavior helps to speed up the transition on the driven side.

For proper full-speed operation, the output current of a device that drives the inputs of the MAX13101E/MAX13102E/MAX13103E/MAX13108E should meet the following requirement:

$$i > 10^8 \times V \times (C + 10\text{pF})$$

where, i is the driver output current, V is the logic-supply voltage (i.e., V_L or V_{CC}) and C is the parasitic capacitance of the signal line.

Enable Output Mode (EN)

The MAX13101E/MAX13102E/MAX13103E feature an enable input (EN) that, when driven low, places the device into shutdown mode. During shutdown, the MAX13101E I/O $V_{CC_}$ ports are pulled down to ground with internal 6k Ω resistors and the I/O $V_{L_}$ ports enter tri-state. MAX13102E I/O $V_{CC_}$ lines enter tri-state and the I/O $V_{L_}$ lines are pulled down to ground with internal 6k Ω resistors. All I/O $V_{CC_}$ and I/O $V_{L_}$ lines on the MAX13103E enter tri-state while the device is in shutdown mode. During shutdown, the V_{CC} supply current reduces to less than 1 μ A, and the V_L supply current reduces to less than 2 μ A. To guarantee minimum shutdown supply current, all I/O $V_{L_}$ need to be driven to GND or V_L , or pulled to GND or V_L through 100k Ω resistors. All I/O $V_{CC_}$ need to be driven to GND or V_{CC} , or pulled to GND or V_{CC} through 100k Ω resistors. Drive EN to logic-high (V_L or V_{CC}) for normal operation.

16-Channel Buffered CMOS Logic-Level Translators

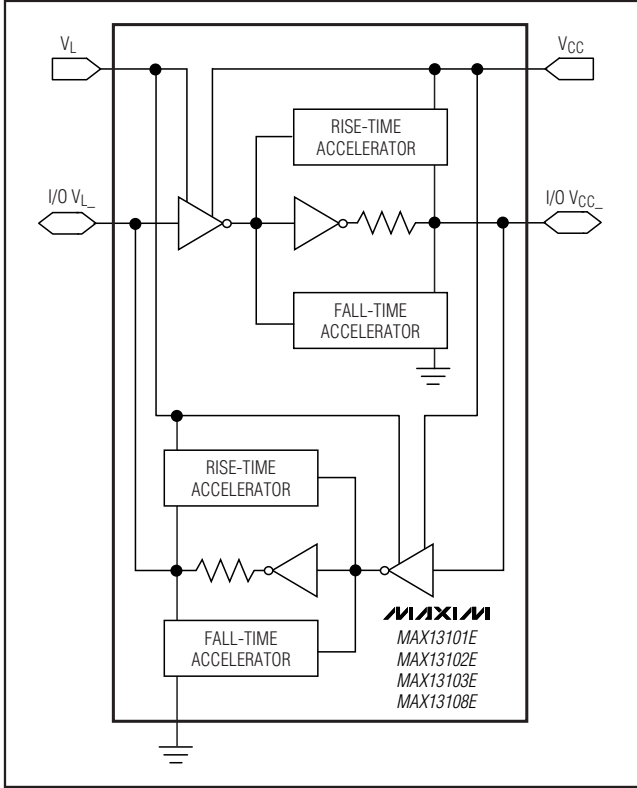

Figure 6. Simplified Diagram (1 I/O Line)

Multiplexing Input (MULT)

The MAX13108E features a multiplexing input (MULT) that enables 8 of the 16 channels and places the remaining 8 into tri-state. Figure 7 depicts a typical multiplexing configuration using the MAX13108E. Drive MULT high to enable I/O VCC1 through I/O VCC8 and I/O VL1 through I/O VL8. Driving MULT high sets I/O VCC9 through I/O VCC16 and I/O VL9 through I/O VL16 into tri-state. Drive MULT low to enable I/O VCC9 through I/O VCC16 and I/O VL9 through I/O VL16. Driving MULT low sets I/O VCC1 through I/O VCC8 and I/O VL1 through I/O VL8 into tri-state.

±15kV ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The I/O VCC_ lines have extra protection against static discharge. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of ±15kV without damage. The ESD structures withstand high ESD in all states: normal operation, tri-state output mode, and powered down. After an ESD event, Maxim's E versions keep working without latchup, whereas competing products can latch and must be powered down to remove the latchup condition.

ESD protection can be tested in various ways. The I/O VCC_ lines of the MAX13101E/ MAX13102E/ MAX13103E/MAX13108E are characterized for protection to ±15kV using the Human Body Model.

Figure 8a. Human Body ESD Test Model

Figure 8b. Human Body Model Current Waveform

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Human Body Model

Figure 8a shows the Human Body Model and Figure 8b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. All pins require this protection during manufacturing, not just inputs and outputs. Therefore, after PC board assembly, the Machine Model is less relevant to I/O ports.

Applications Information

Power-Supply Decoupling

To reduce ripple and the chance of transmitting incorrect data, bypass V_L and V_{CC} to ground with 0.1μF capacitors. To ensure full ±15kV ESD protection, bypass V_{CC} to ground with a 1μF ceramic capacitor. Place all capacitors as close to the power-supply inputs as possible.

Capacitive Loading

Capacitive loading on the I/O lines impacts the rise time (and fall time) of the MAX13101E/MAX13102E/MAX13103E/MAX13108E when driving the signal lines. The actual rise time is a function of the parasitic capacitance, the supply voltage, and the drive impedance of the MAX13101E/MAX13102E/MAX13103E/MAX13108E. For proper operation, the signal must reach the V_{OH} as required before the rise-time accelerators turn off.
