CY7C1381CV25
CY7C1383CV25

18-Mbit (512K x 36/1M x 18) Flow-Through SRAM

Features

- **Supports 133-MHz bus operations**
- **512K X 36/1M X 18 common I/O**
- **2.5V +/–5% core power supply (V_{DD})**
- **2.5V I/O supply (V_{DDQ})**
- **Fast clock-to-output times**
  - **— 6.5 ns (133-MHz version)**
  - **— 7.5 ns (117-MHz version)**
  - **— 8.5 ns (100-MHz version)**
- **Provide high-performance 2-1-1-1 access rate**
- **User-selectable burst counter supporting Intel® Pentium® interleaved or linear burst sequences**
- **Separate processor and controller address strobes**
- **Synchronous self-timed write**
- **Asynchronous output enable**
- **Offered in JEDEC-standard 100-pin TQFP,119-ball BGA and 165-ball fBGA packages**
- **JTAG boundary scan for BGA and fBGA packages**
- **"ZZ" Sleep Mode option**

Functional Description[1]

The CY7C1381CV25/CY7C1383CV25 is a 2.5V, 512K x 36 and 1M x 18 Synchronous Flow through SRAMs, respectively designed to interface with high-speed microprocessors with minimum glue logic. Maximum access delay from clock rise is 6.5 ns (133-MHz version). A 2-bit on-chip counter captures the first address in a burst and increments the address automatically for the rest of the burst access. All synchronous inputs are gated by registers controlled by a positive-edge-triggered Clock Input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining Chip Enable ($\overline{CE_1}$), depth-expansion Chip Enables (CE_2 and $\overline{CE_3}$[2]), Burst Control inputs ($\overline{ADSC}$, $\overline{ADSP}$, and $\overline{ADV}$), Write Enables ($\overline{BW_x}$, and $\overline{BWE}$), and Global Write ($\overline{GW}$). Asynchronous inputs include the Output Enable ($\overline{OE}$) and the ZZ pin.

The CY7C1381CV25/CY7C1383CV25 allows either interleaved or linear burst sequences, selected by the MODE input pin. A HIGH selects an interleaved burst sequence, while a LOW selects a linear burst sequence. Burst accesses can be initiated with the Processor Address Strobe ($\overline{ADSP}$) or the cache Controller Address Strobe ($\overline{ADSC}$) inputs. Address advancement is controlled by the Address Advancement ($\overline{ADV}$) input.

Addresses and chip enables are registered at rising edge of clock when either Address Strobe Processor ($\overline{ADSP}$) or Address Strobe Controller ($\overline{ADSC}$) are active. Subsequent burst addresses can be internally generated as controlled by the Advance pin ($\overline{ADV}$).

The CY7C1381CV25/CY7C1383CV25 operates from a +2.5V core power supply. All outputs also operate with a +2.5 supply. All inputs and outputs are JEDEC-standard JESD8-5-compatible.

Selection Guide

	133 MHz	117 MHz	100 MHz	Unit
Maximum Access Time	6.5	7.5	8.5	ns
Maximum Operating Current	210	190	175	mA
Maximum CMOS Standby Current	70	70	70	mA

Notes:
1. For best–practices recommendations, please refer to the Cypress application note *System Design Guidelines* on www.cypress.com.
2. $\overline{CE_3}$, CE_2 are for TQFP and 165 fBGA package only. 119 BGA is offered only in 1 Chip Enable.

CY7C1381CV25–Pin Definitions

Name	TQFP (3-Chip Enable)	BGA (1-Chip Enable)	fBGA (3-Chip Enable)	I/O	Description
A_0, A_1, A	37,36,32,33,34, 35,42,43,44,45, 46,47,48,49,50, 81,82,99,100	P4,N4,A2,B2,C2 ,R2,A3,B3,C3,T 3,T4,A5,B5,C5, T5,A6,B6,C6,R6	R6,P6,A2,A10, B2,B10,N6,P3, P4,P8,P9,P10, P11,R3,R4,R8, R9,R10,R11	Input-Synchronous	**Address Inputs used to select one of the 512K address location**s. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and $\overline{CE}_1$, CE_2, and $\overline{CE}_3$[2] are sampled active. $A_{[1:0]}$ feed the 2-bit counter.
$\overline{BW}_A$, $\overline{BW}_B$ $\overline{BW}_C$, $\overline{BW}_D$	93,94,95,96	L5,G5,G3,L3	B5,A5,A4,B4	Input-Synchronous	**Byte Write Select Inputs, active LOW**. Qualified with $\overline{BWE}$ to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.
$\overline{GW}$	88	H4	B7	Input-Synchronous	**Global Write Enable Input, active LOW**. When asserted LOW on the rising edge of CLK, a global write is conducted (ALL bytes are written, regardless of the values on $\overline{BW}_{[A:D]}$and $\overline{BWE}$).
CLK	89	K4	B6	Input-Clock	**Clock Input**. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when $\overline{ADV}$ is asserted LOW, during a burst operation.
$\overline{CE}_1$	98	E4	A3	Input-Synchronous	**Chip Enable 1 Input, active LOW**. Sampled on the rising edge of CLK. Used in conjunction with CE_2 and $\overline{CE}_3$[2] to select/deselect the device. $\overline{ADSP}$ is ignored if $\overline{CE}_1$ is HIGH.
CE_2	97	-	B3	Input-Synchronous	**Chip Enable 2 Input, active HIGH**. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_3$[2] to select/deselect the device.
$\overline{CE}_3$[2]	92	-	A6	Input-Synchronous	**Chip Enable 3 Input, active LOW**. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and CE_2 to select/deselect the device.
$\overline{OE}$	86	F4	B8	Input-Asynchronous	**Output Enable, asynchronous input, active LOW**. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tri-stated, and act as input data pins. $\overline{OE}$ is masked during the first clock of a read cycle when emerging from a deselected state.
$\overline{ADV}$	83	G4	A9	Input-Synchronous	**Advance Input signal, sampled on the rising edge of CLK**. When asserted, it automatically increments the address in a burst cycle.
$\overline{ADSP}$	84	A4	B9	Input-Synchronous	**Address Strobe from Processor, sampled on the rising edge of CLK, active LOW**. When asserted LOW, addresses presented to the device are captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When $\overline{ADSP}$ and $\overline{ADSC}$ are both asserted, only $\overline{ADSP}$ is recognized. ASDP is ignored when $\overline{CE}_1$ is deasserted HIGH

CY7C1381CV25–Pin Definitions (continued)

Name	TQFP (3-Chip Enable)	BGA (1-Chip Enable)	fBGA (3-Chip Enable)	I/O	Description
$\overline{ADSC}$	85	B4	A8	Input-Synchronous	**Address Strobe from Controller, sampled on the rising edge of CLK, active LOW**. When asserted LOW, addresses presented to the device are captured in the address registers. $A_{[1:0]}$ are also loaded into the burst counter. When $\overline{ADSP}$ and $\overline{ADSC}$ are both asserted, only $\overline{ADSP}$ is recognized·
$\overline{BWE}$	87	M4	A7	Input-Synchronous	**Byte Write Enable Input, active LOW**. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
ZZ	64	T7	H11	Input-Asynchronous	**ZZ "sleep" Input, active HIGH**. When asserted HIGH places the device in a non-time-critical "sleep" condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull-down.
DQ_s	52,53,56,57,58, 59,62,63,68,69, 72,73,74,75,78, 79,2,3,6,7,8,9, 12,13,18,19,22, 23,24,25,28,29	K6,L6,M6,N6,K7 ,L7,N7,P7,E6,F 6,G6,H6,D7,E7, G7,H7,D1,E1,G 1,H1,E2,F2,G2, H2,K1,L1,N1,P1 ,K2,L2,M2,N2	M11,L11,K11, J11,J10,K10, L10,M10,D10, E10,F10,G10, D11,E11,F11, G11,D1,E1, F1,G1,D2,E2, F2,G2,J1,K1, L1,M1,J2, K2,L2,M2,	I/O-Synchronous	**Bidirectional Data I/O lines**. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{OE}$. When $\overline{OE}$ is asserted LOW, the pins behave as outputs. When HIGH, DQ_s and $DQP_{[A:D]}$ are placed in a tri-state condition.The outputs are automatically tri-stated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of $\overline{OE}$.
$DQP_{[A:D]}$	51,80,1,30	P6,D6,D2,P2	N11,C11,C1,N1	I/O-Synchronous	**Bidirectional Data Parity I/O Lines.** Functionally, these signals are identical to DQ_s. During write sequences, $DQP_{[A:D]}$ is controlled by $\overline{BW}_{[A:D]}$ correspondingly.
MODE	31	R3	R1	Input-Static	**Selects Burst Order**. When tied to GND selects linear burst sequence. When tied to V_{DD} or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. Mode Pin has an internal pull-up.
V_{DD}	15,41,65,91	J2,C4,J4,R4,J6	D4,D8,E4, E8,F4,F8, G4,G8,H4, H8,J4,J8, K4,K8,L4, L8,M4,M8	Power Supply	**Power supply inputs to the core of the device**.

When $\overline{ADSP}$ and $\overline{ADSC}$ are both asserted, only $\overline{ADSP}$ is recognized·
ZZ	64	T7	H11	Input-Asynchronous	**ZZ "sleep" Input, active HIGH**. When asserted HIGH places the device in a non-time-critical "sleep" condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull-down.
DQ_s	58,59,62,63,68, 69,72,73,8,9,12, 13, 18,19,22,23	P7,K7,G7,E7,F6 ,H6,L6,N6,D1,H 1,L1,N1,E2,G2, K2,M2	J10,K10, L10,M10, D11,E11, F11,G11,J1,K1, L1,M1, D2,E2,F2, G2	I/O-Synchronous	**Bidirectional Data I/O lines**. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{OE}$. When $\overline{OE}$ is asserted LOW, the pins behave as outputs. When HIGH, DQ_s and $DQP_{[A:B]}$ are placed in a tri-state condition.The outputs are automatically tri-stated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of $\overline{OE}$.
$DQP_{[A:B]}$	74,24	D6,P2	C11,N1	I/O-Synchronous	**Bidirectional Data Parity I/O Lines.** Functionally, these signals are identical to DQ_s. During write sequences, $DQP_{[A:B]}$ is controlled by $\overline{BW}_{[A:B]}$ correspondingly.
MODE	31	R3	R1	Input-Static	**Selects Burst Order**. When tied to GND selects linear burst sequence. When tied to V_{DD} or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. Mode Pin has an internal pull-up.

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CDV}) is 6.5 ns (133-MHz device).

The CY7C1381CV25 supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium® and i486 processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user-selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the Processor Address Strobe ($\overline{ADSP}$) or the Controller Address Strobe ($\overline{ADSC}$). Address advancement through the burst sequence is controlled by the $\overline{ADV}$ input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the Byte Write Enable ($\overline{BWE}$) and Byte Write Select ($\overline{BW}$x) inputs. A Global Write Enable ($\overline{GW}$) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous Chip Selects ($\overline{CE}_1$, CE_2, $\overline{CE}_3$[2]) and an asynchronous Output Enable ($\overline{OE}$) provide for easy bank selection and output tri-state control. $\overline{ADSP}$ is ignored if $\overline{CE}_1$ is HIGH.

Single Read Accesses

A single read access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2, and $\overline{CE}_3$[2] are all asserted active, and (2) $\overline{ADSP}$ or $\overline{ADSC}$ is asserted LOW (if the access is initiated by $\overline{ADSC}$, the write inputs must be deasserted during this first cycle). The address presented to the address inputs is latched into the address register and the burst counter/control logic and presented to the memory core. If the $\overline{OE}$ input is asserted LOW, the requested data will be available at the data outputs a maximum to t_{CDV} after clock rise. $\overline{ADSP}$ is ignored if $\overline{CE}_1$ is HIGH.

Single Write Accesses Initiated by $\overline{ADSP}$

This access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2, $\overline{CE}_3$[2] are all asserted active, and (2) $\overline{ADSP}$ is asserted LOW. The addresses presented are loaded into the address register and the burst inputs ($\overline{GW}$, $\overline{BWE}$, and $\overline{BW}_X$)are ignored during this first clock cycle. If the write inputs are asserted active (see Write Cycle Descriptions table for appropriate states that indicate a write) on the next clock rise,the appropriate data will be latched and written into the device.Byte writes are allowed. All I/Os are tri-stated during a byte write.Since this is a common I/O device, the asynchronous $\overline{OE}$ input signal must be deasserted and the I/Os must be tri-stated prior to the presentation of data to DQs. As a safety precaution, the data lines are tri-stated once a write cycle is detected, regardless of the state of $\overline{OE}$.

Single Write Accesses Initiated by $\overline{ADSC}$

This write access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{CE}_1$, CE_2, and $\overline{CE}_3$[2] are all asserted active, (2) $\overline{ADSC}$ is asserted LOW, (3) $\overline{ADSP}$ is deasserted HIGH, and (4) the write input signals ($\overline{GW}$, $\overline{BWE}$, and $\overline{BW}_X$) indicate a write access. $\overline{ADSC}$ is ignored if $\overline{ADSP}$ is active LOW.

The addresses presented are loaded into the address register and the burst counter/control logic and delivered to the memory core. The information presented to $DQ_{[A:D]}$ will be written into the specified address location. Byte writes are allowed. All I/Os are tri-stated when a write is detected, even a byte write. Since this is a common I/O device, the asynchronous $\overline{OE}$ input signal must be deasserted and the I/Os must be tri-stated prior to the presentation of data to DQs. As a safety precaution, the data lines are tri-stated once a write cycle is detected, regardless of the state of $\overline{OE}$.

Burst Sequences

The CY7C1381CV25 provides an on-chip two-bit wraparound burst counter inside the SRAM. The burst counter is fed by $A_{[1:0]}$, and can follow either a linear or interleaved burst order. The burst order is determined by the state of the MODE input. A LOW on MODE will select a linear burst sequence. A HIGH on MODE will select an interleaved burst order. Leaving MODE unconnected will cause the device to default to a interleaved burst sequence.

Interleaved Burst Address Table (MODE = Floating or V_{DD})

First Address A1: A0	Second Address A1: A0	Third Address A1: A0	Fourth Address A1: A0
00	01	10	11
01	00	11	10
10	11	00	01
11	10	01	00

Linear Burst Address Table (MODE = GND)

00	01	10	11
01	10	11	00
10	11	00	01
11	00	01	10

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation “sleep” mode. Two clock cycles are required to enter into or exit from this “sleep” mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the “sleep” mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the “sleep” mode. $\overline{CE}_1$, CE_2, $\overline{CE}_3$[2], $\overline{ADSP}$, and $\overline{ADSC}$ must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

ZZ Mode Electrical Characteristics

Parameter	Description	Test Conditions	Min.	Max.	Unit
I_{DDZZ}	Snooze mode standby current	ZZ ≥ V_{DD} – 0.2V		60	mA
t_{ZZS}	Device operation to ZZ	ZZ ≥ V_{DD} – 0.2V		$2t_{CYC}$	ns
t_{ZZREC}	ZZ recovery time	ZZ ≤ 0.2V	$2t_{CYC}$		ns

Notes:
3. X="Don't Care." H = Logic HIGH, L = Logic LOW.
4. $\overline{WRITE}$ = L when any one or more Byte Write enable signals and $\overline{BWE}$ = L or $\overline{GW}$= L. $\overline{WRITE}$ = H when all Byte write enable signals, $\overline{BWE}$, $\overline{GW}$ = H.
5. The DQ pins are controlled by the current cycle and the $\overline{OE}$ signal. $\overline{OE}$ is asynchronous and is not sampled with the clock.
6. The SRAM always initiates a read cycle when $\overline{ADSP}$ is asserted, regardless of the state of $\overline{GW}$, $\overline{BWE}$, or $\overline{BW_X}$. Writes may occur only on subsequent clocks after the $\overline{ADSP}$ or with the assertion of $\overline{ADSC}$. As a result, $\overline{OE}$ must be driven HIGH prior to the start of the write cycle to allow the outputs to tri-state. $\overline{OE}$ is a don't care for the remainder of the write cycle.
7. $\overline{OE}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are Tri-State when $\overline{OE}$ is inactive or when the device is deselected, and all data bits behave as output when $\overline{OE}$ is active (LOW).

IEEE 1149.1 Serial Boundary Scan (JTAG)

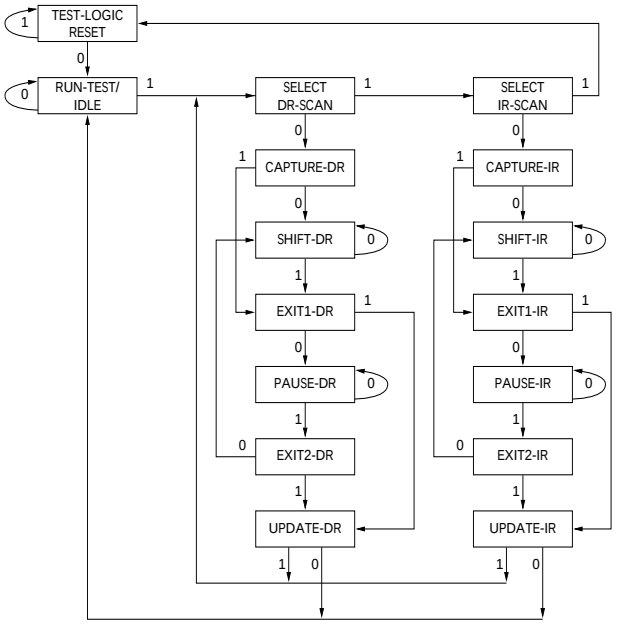
The CY7C1381CV25 incorporates a serial boundary scan test access port (TAP). This port operates in accordance with IEEE Standard 1149.1-1990 but does not have the set of functions required for full 1149.1 compliance. These functions from the IEEE specification are excluded because their inclusion places an added delay in the critical speed path of the SRAM. Note that the TAP controller functions in a manner that does not conflict with the operation of other devices using 1149.1 fully compliant TAPs. The TAP operates using JEDEC-standard 2.5V I/O logic levels.

The CY7C1381CV25 contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW(V_{SS}) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to V_{DD} through a pull-up resistor. TDO should be left unconnected. Upon power-up, the device will come up in a reset state which will not interfere with the operation of the device.

TAP Controller State Diagram



The 0/1 next to each state represents the value of TMS at the rising edge of TCK.

Test Access Port (TAP)

Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

Test MODE SELECT (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. It is allowable to leave this ball unconnected if the TAP is not used. The ball is pulled up internally, resulting in a logic HIGH level.

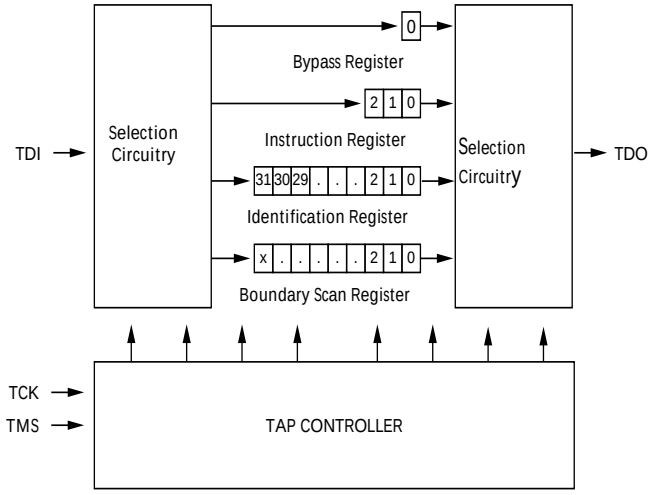
Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information on loading the instruction register, see Figure . TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register. (See Tap Controller Block Diagram.)

Test Data-Out (TDO)

The TDO output ball is used to serially clock data-out from the registers. The output is active depending upon the current state of the TAP state machine. The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register. (See Tap Controller State Diagram.)

TAP Controller Block Diagram



Performing a TAP Reset

A RESET is performed by forcing TMS HIGH (VDD) for five rising edges of TCK. This RESET does not affect the operation of the SRAM and may be performed while the SRAM is operating.

At power-up, the TAP is reset internally to ensure that TDO comes up in a High-Z state.

TAP Registers

Registers are connected between the TDI and TDO balls and allow data to be scanned into and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction register. Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

Instruction Register

Three-bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the Tap Controller Block Diagram. Upon power-up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary “01” pattern to allow for fault isolation of the board-level serial test data path.

Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single-bit register that can be placed between the TDI and TDO balls. This allows data to be shifted through the SRAM with minimal delay. The bypass register is set LOW (V_{SS}) when the BYPASS instruction is executed.

Boundary Scan Register

The boundary scan register is connected to all the input and bidirectional balls on the SRAM. The x36 configuration has a 70-bit-long register and the x18 configuration has a 51-bit long register.

The boundary scan register is loaded with the contents of the RAM I/O ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD and SAMPLE Z instructions can be used to capture the contents of the I/O ring.

The Boundary Scan Order tables show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI, and the LSB is connected to TDO.

Identification (ID) Register

The ID register is loaded with a vendor-specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in the Identification Register Definitions table.

TAP Instruction Set

Overview

Eight different instructions are possible with the three bit instruction register. All combinations are listed in the Instruction Codes table. Three of these instructions are listed as RESERVED and should not be used. The other five instructions are described in detail below.

The TAP controller used in this SRAM is not fully compliant to the 1149.1 convention because some of the mandatory 1149.1 instructions are not fully implemented.

The TAP controller cannot be used to load address data or control signals into the SRAM and cannot preload the I/O buffers. The SRAM does not implement the 1149.1 commands EXTEST or INTEST or the PRELOAD portion of SAMPLE/PRELOAD; rather, it performs a capture of the I/O ring when these instructions are executed.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction once it is shifted in, the TAP controller needs to be moved into the Update-IR state.

EXTEST

EXTEST is a mandatory 1149.1 instruction which is to be executed whenever the instruction register is loaded with all 0s. EXTEST is not implemented in this SRAM TAP controller, and therefore this device is not compliant to 1149.1. The TAP controller does recognize an all-0 instruction.

When an EXTEST instruction is loaded into the instruction register, the SRAM responds as if a SAMPLE/PRELOAD instruction has been loaded. There is one difference between the two instructions. Unlike the SAMPLE/PRELOAD instruction, EXTEST places the SRAM outputs in a High-Z state.

IDCODE

The IDCODE instruction causes a vendor-specific, 32-bit code to be loaded into the instruction register. It also places the instruction register between the TDI and TDO balls and allows the IDCODE to be shifted out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register upon power-up or whenever the TAP controller is given a test logic reset state.

SAMPLE Z

The SAMPLE Z instruction causes the boundary scan register to be connected between the TDI and TDO balls when the TAP controller is in a Shift-DR state. It also places all SRAM outputs into a High-Z state.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. The PRELOAD portion of this instruction is not implemented, so the device TAP controller is not fully 1149.1 compliant.

When the SAMPLE/PRELOAD instruction is loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and bidirectional balls is captured in the boundary scan register.

The user must be aware that the TAP controller clock can only operate at a frequency up to 10 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output will undergo a transition. The TAP may then try to capture a signal while in transition (metastable state). This will not harm the device, but there is no guarantee as to the value that will be captured. Repeatable results may not be possible.

To guarantee that the boundary scan register will capture the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller’s capture setup plus hold time (t_{CS} plus t_{CH}).

The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still

possible to capture all other signals and simply ignore the value of the CLK captured in the boundary scan register.

Once the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO balls.

Note that since the PRELOAD part of the command is not implemented, putting the TAP to the Update-DR state while performing a SAMPLE/PRELOAD instruction will have the same effect as the Pause-DR command.

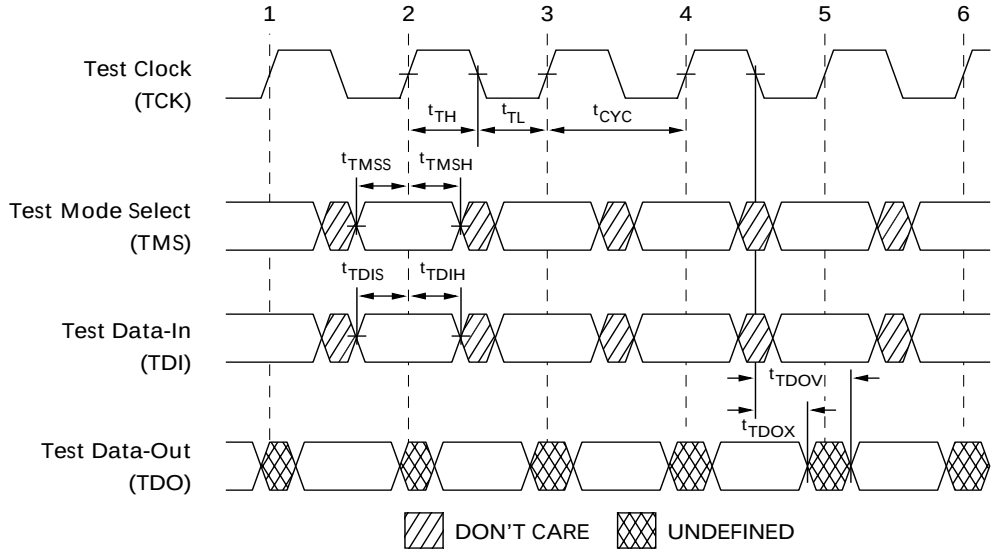
BYPASS

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO balls. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

Reserved

These instructions are not implemented but are reserved for future use. Do not use these instructions.

TAP Timing



TAP AC Switching Characteristics Over the operating Range[9, 10]

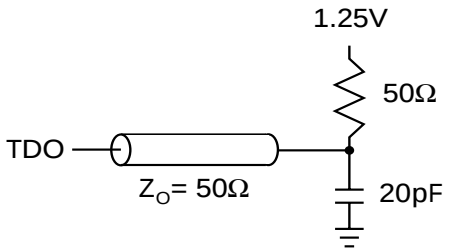
TMS Set-Up to TCK Clock Rise	t_{TMSS}	10		ns
TDI Set-Up to TCK Clock Rise	t_{TDIS}	10		ns
Capture Set-Up to TCK Rise	t_{CS}	10		
Hold Times				
TMS hold after TCK Clock Rise	t_{TMSH}	10		ns
TDI Hold after Clock Rise	t_{TDIH}	10		ns
Capture Hold after Clock Rise	t_{CH}	10		ns

Notes:
9. ^{t}CS and ^{t}CH refer to the setup and hold time requirements of latching data from the boundary scan register.
10. Test conditions are specified using the load in TAP AC test Conditions. T_R/t_F = 1ns

2.5V TAP AC Test Conditions

Input pulse levels ....VSS to 2.5V
Input rise and fall time..... 1ns
Input timing reference levels.....1.25V
Output reference levels.....1.25V
Test load termination supply voltage.....1.25V

2.5V TAP AC Output Load Equivalent



TAP DC Electrical Characteristics And Operating Conditions

(0°C < TA < +70°C; Vdd = 2.5V ±0.125V unless otherwise noted)[11]

PARAMETER	DESCRIPTION	TEST CONDITIONS		MIN	MAX	UNITS
V_{OH1}	Output HIGH Voltage	I_{OH} = -1.0 mA, V_{DDQ} = 2.5V		2.0		V
V_{OH2}	Output HIGH Voltage	I_{OH} = -100 µA,V_{DDQ} = 2.5V		2.1		V
V_{OL1}	Output LOW Voltage	I_{OL} = 8.0 mA, V_{DDQ} = 2.5V			0.4	V
V_{OL2}	Output LOW Voltage	I_{OL} = 100 µA	V_{DDQ} = 2.5V		0.2	V
V_{IH}	Input HIGH Voltage		V_{DDQ} = 2.5V	1.7	V_{DD} + 0.3	V
V_{IL}	Input LOW Voltage		V_{DDQ} = 2.5V	-0.3	0.7	V
I_X	Input Load Current	GND ≤ V_{IN} ≤ V_{DDQ}		-5	5	µA

Note:
11. All voltages referenced to VSS (GND).

Identification Register Definitions

INSTRUCTION FIELD	CY7C1381CV25 (512KX36)	CY7C1383CV25 (1MX18)	DESCRIPTION
Revision Number (31:29)	010	010	Describes the version number.
Device Depth (28:24)	01011	01011	Reserved for Internal Use
Device Width (23:18)	000001	000001	Defines memory type and architecture
Cypress Device ID (17:12)	100101	010101	Defines width and density
Cypress JEDEC ID Code (11:1)	00000110100	00000110100	Allows unique identification of SRAM vendor.
ID Register Presence Indicator (0)	1	1	Indicates the presence of an ID register.

Scan Register Sizes

REGISTER NAME	BIT SIZE(X36)	BIT SIZE(X18)
Instruction Bypass	3	3
Bypass	1	1
ID	32	32
Boundary Scan Order	72	72

Identification Codes

INSTRUCTION	CODE	DESCRIPTION
EXTEST	000	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM outputs to High-Z state. This instruction is not 1149.1 compliant.
IDCODE	001	Loads the ID register with the vendor ID code and places the register between TDI and TDO. This operation does not affect SRAM operations.
SAMPLE Z	010	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Forces all SRAM output drivers to a High-Z state.
RESERVED	011	Do Not Use: This instruction is reserved for future use.
SAMPLE/PRELOAD	100	Captures I/O ring contents. Places the boundary scan register between TDI and TDO. Does not affect SRAM operation. This instruction does not implement 1149.1 preload function and is therefore not 1149.1 compliant.
RESERVED	101	Do Not Use: This instruction is reserved for future use.
RESERVED	110	Do Not Use: This instruction is reserved for future use.
BYPASS	111	Places the bypass register between TDI and TDO. This operation does not affect SRAM operations.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature .....–65°C to +150°C

Ambient Temperature with Power Applied.....–55°C to +125°C

Supply Voltage on V_{DD} Relative to GND..... –0.3V to +4.6V

DC Voltage Applied to Outputs in Tri-State..... –0.5V to V_{DDQ} + 0.5V

DC Input Voltage.....–0.5V to V_{DD} + 0.5V

Current into Outputs (LOW)..... 20 mA

Static Discharge Voltage..... >2001V (per MIL-STD-883, Method 3015)

Latch-up Current..... >200 mA

Operating Range

Range	Ambient Temperature	V_{DD}	V_{DDQ}
Commercial	0°C to +70°C	2.5V +/– 5%	2.5V – 5% to V_{DD}
Industrial	-40°C to +85°C		

Electrical Characteristics Over the Operating Range[12, 13]

Parameter	Description	Test Conditions		Min.	Max.	Unit
V_{DD}	Power Supply Voltage			2.375	2.625	V
V_{DDQ}	I/O Supply Voltage	V_{DDQ} = 2.5V		2.375	V_{DD}	V
V_{OH}	Output HIGH Voltage	V_{DDQ} = 2.5V, V_{DD} = Min., I_{OH} = –1.0 mA		2.0		V
V_{OL}	Output LOW Voltage	V_{DDQ} = 2.5V, V_{DD} = Min., I_{OL} = 1.0 mA			0.4	V
V_{IH}	Input HIGH Voltage[12]	V_{DDQ} = 2.5V		1.7	V_{DD} + 0.3V	V
V_{IL}	Input LOW Voltage[12]	V_{DDQ} = 2.5V		–0.3	0.7	V
I_X	Input Load	GND ≤ V_I ≤ V_{DDQ}		–5	5	µA
	Input Current of MODE	Input = V_{SS}		–30		µA
		Input = V_{DD}			30	µA
	Input Current of ZZ	Input = V_{SS}		–30		µA
		Input = V_{DD}			30	µA
I_{OZ}	Output Leakage Current	GND ≤ V_I ≤ V_{DD}, Output Disabled		–5	5	µA
I_{OS}	Output Short Circuit Current	V_{DD} = Max., V_{OUT} = GND			-300	µA
I_{DD}	V_{DD} Operating Supply Current	V_{DD} = Max., I_{OUT} = 0 mA, f = f_{MAX} = $1/t_{CYC}$	7.5-ns cycle, 133 MHz		210	mA
			8.8-ns cycle, 117 MHz		190	mA
			10-ns cycle, 100 MHz		175	mA
I_{SB1}	Automatic CE Power-down Current—TTL Inputs	Max. V_{DD}, Device Deselected, V_{IN} ≥ V_{IH} or V_{IN} ≤ V_{IL}, f = f_{MAX}, inputs switching	7.5-ns cycle, 133 MHz		120	mA
			8.8-ns cycle, 117 MHz		110	mA
			10-ns cycle, 100 MHz		100	
I_{SB2}	Automatic CE Power-down Current—CMOS Inputs	Max. V_{DD}, Device Deselected, V_{IN} ≥ V_{DD} – 0.3V or V_{IN} ≤ 0.3V, f = 0, inputs static	All speeds		70	mA
I_{SB3}	Automatic CE Power-down Current—CMOS Inputs	Max. V_{DD}, Device Deselected, V_{IN} ≥ V_{DDQ} – 0.3V or V_{IN} ≤ 0.3V, f = f_{MAX}, inputs switching	7.5-ns cycle, 133 MHz		105	mA
			8.8-ns cycle, 117 MHz		100	mA
			10-ns cycle, 100 MHz		95	mA
I_{SB4}	Automatic CE Power-down Current—TTL Inputs	Max. V_{DD}, Device Deselected, V_{IN} ≥ V_{DD} – 0.3V or V_{IN} ≤ 0.3V, f = 0, inputs static	All Speeds		80	mA

Notes:
12. Overshoot: $V_{IH}(AC) < V_{DD}$ +1.5V (Pulse width less than $t_{CYC}/2$), undershoot: $V_{IL}(AC) > -2V$ (Pulse width less than $t_{CYC}/2$).
13. $T_{Power\text{-}up}$: Assumes a linear ramp from 0v to V_{DD}(min.) within 200ms. During this time $V_{IH} \le V_{DD}$ and $V_{DDQ} \le V_{DD}$

Thermal Resistance[14]

Parameter	Description	Test Conditions	TQFP Package	BGA Package	fBGA Package	Unit
Θ_{JA}	Thermal Resistance (Junction to Ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA / JESD51.	31	45	46	°C/W
Θ_{JC}	Thermal Resistance (Junction to Case)		6	7	3	°C/W

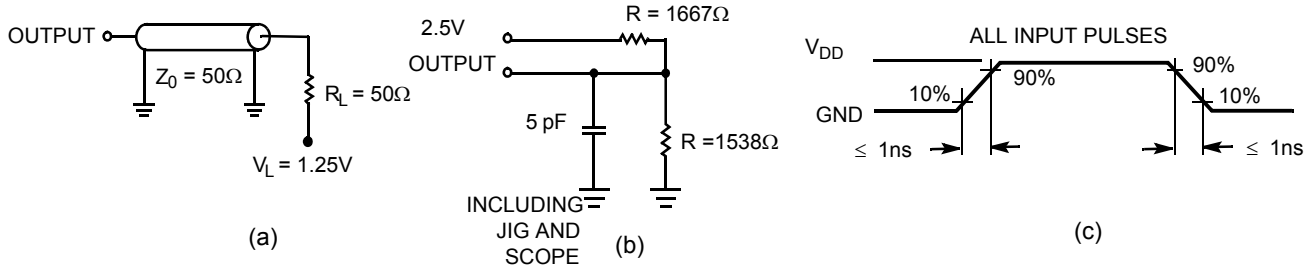
Capacitance[14]

Parameter	Description	Test Conditions	TQFP Package	BGA Package	fBGA Package	Unit
C_{IN}	Input Capacitance	T_A = 25°C, f = 1 MHz, V_{DD} = 2.5V.	5	8	9	pF
C_{CLK}	Clock Input Capacitance		5	8	9	pF
$C_{I/O}$	Input/Output Capacitance		5	8	9	pF

Notes:
14. Tested initially and after any design or process change that may affect these parameters

AC Test Loads and Waveforms

2.5V I/O Test Load



Switching Characteristics Over the Operating Range[19, 20]

Parameter	Description	133 MHz		117 MHz		100 MHz		Unit
		Min.	Max.	Min.	Max.	Min.	Max.	
t_{POWER}	V_{DD}(Typical) to the first Access[15]	1		1		1		ms
Clock

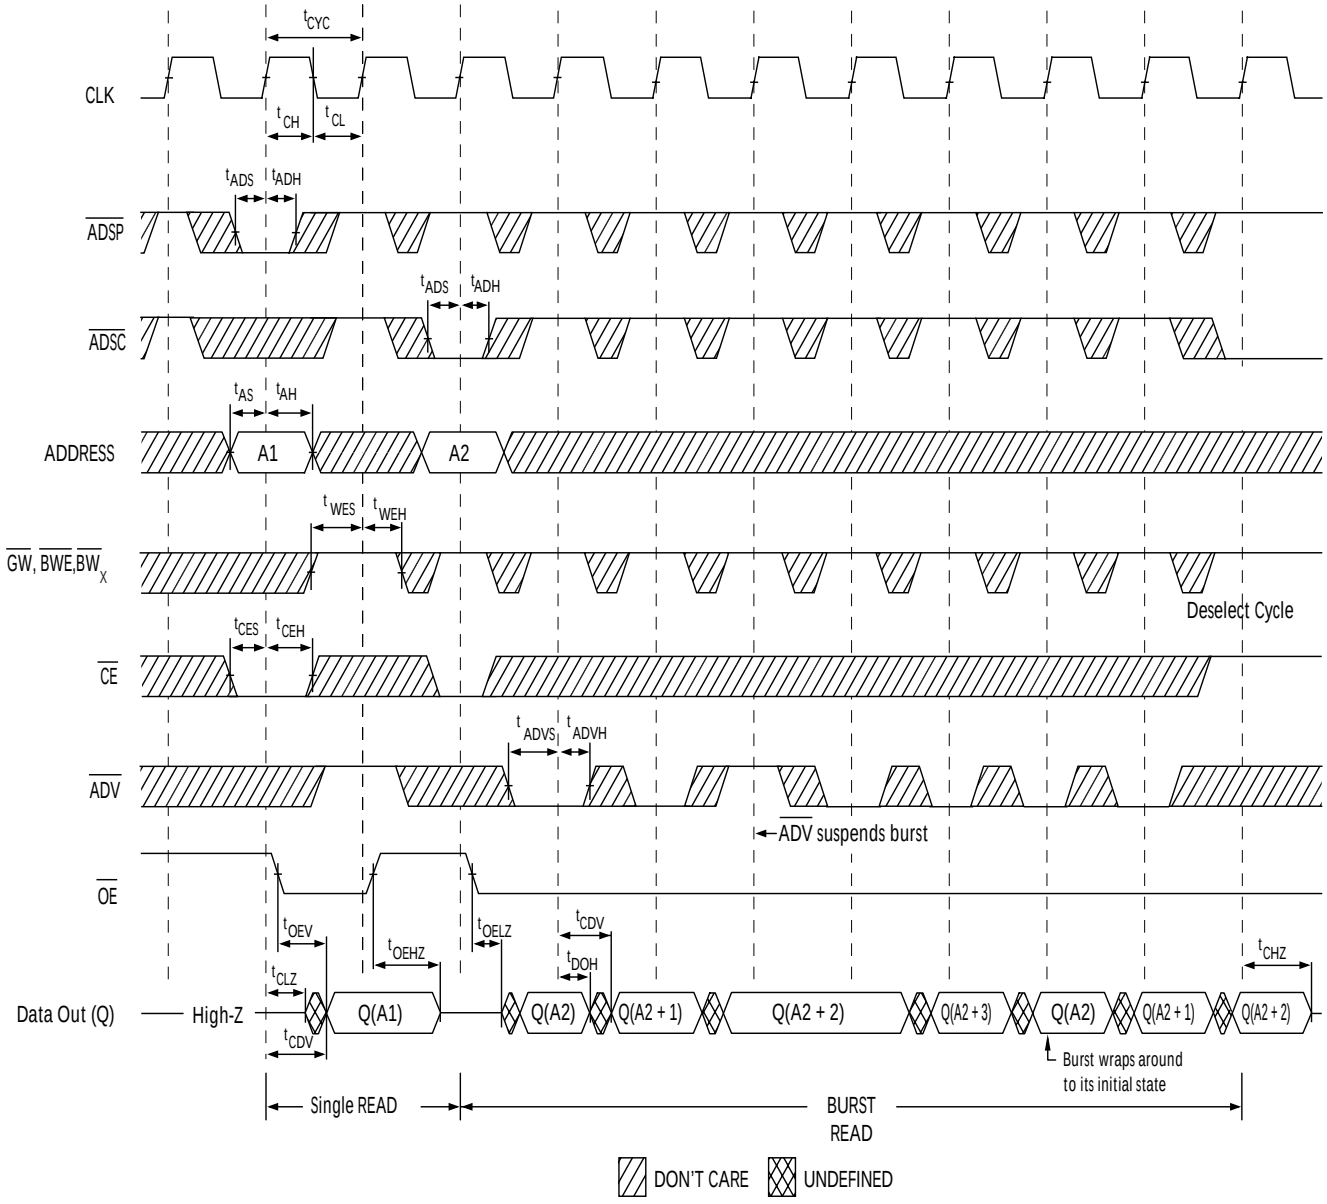
Hold Times								
t_{AH}	Address Hold After CLK Rise	0.5		0.5		0.5		ns
t_{ADH}	$\overline{ADSP}$, $\overline{ADSC}$ Hold After CLK Rise	0.5		0.5		0.5		ns
t_{WEH}	$\overline{GW}$,$\overline{BWE}$, $\overline{BW}_{[A:D]}$ Hold After CLK Rise	0.5		0.5		0.5		ns
t_{ADVH}	$\overline{ADV}$ Hold After CLK Rise	0.5		0.5		0.5		ns
t_{DH}	Data Input Hold After CLK Rise	0.5		0.5		0.5		ns
t_{CEH}	Chip Enable Hold After CLK Rise	0.5		0.5		0.5		ns

Notes:

15. This part has a voltage regulator internally; t_{POWER} is the time that the power needs to be supplied above V_{DD}(minimum) initially, before a read or write operation can be initiated.
16. t_{CHZ}, t_{CLZ},t_{OELZ}, and t_{OEHZ} are specified with AC test conditions shown in part (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
17. At any given voltage and temperature, t_{OEHZ} is less than t_{OELZ} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve High-Z prior to Low-Z under the same system conditions
18. This parameter is sampled and not 100% tested.
19. Timing reference level is 1.25V.
20. Test conditions shown in (a) of AC Test Loads unless otherwise noted.

Timing Diagrams

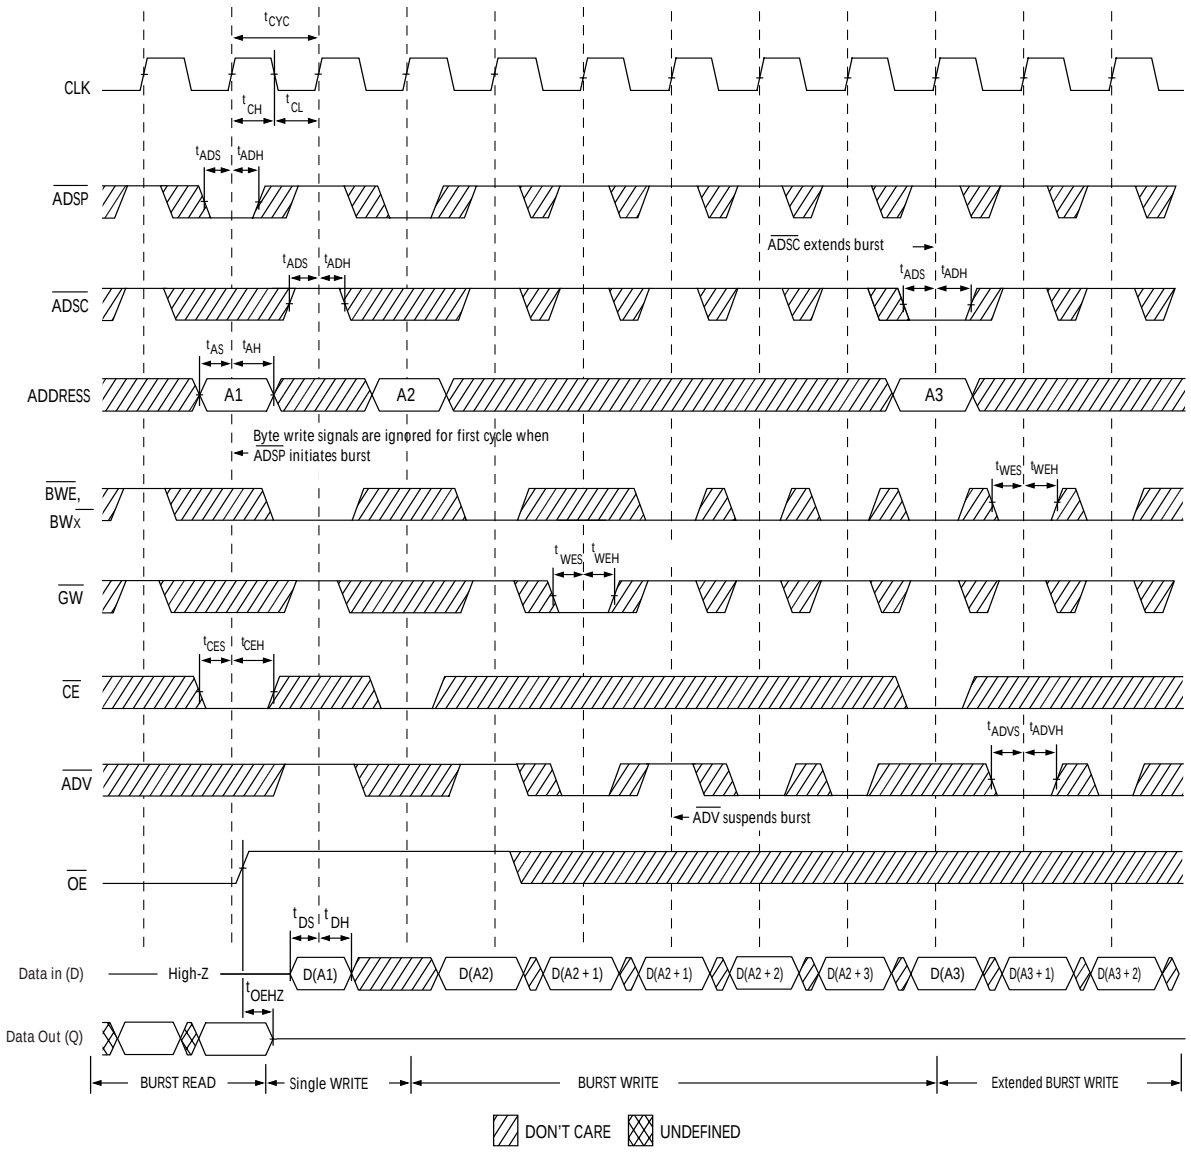
Read Cycle Timing[21]



Notes:
21. On this diagram, when $\overline{CE}$ is LOW: $\overline{CE}_1$ is LOW, CE_2 is HIGH and $\overline{CE}_3$ is LOW. When $\overline{CE}$ is HIGH: $\overline{CE}_1$ is HIGH or CE_2 is LOW or $\overline{CE}_3$ is HIGH.

Timing Diagrams (continued)

Write Cycle Timing[21, 22]

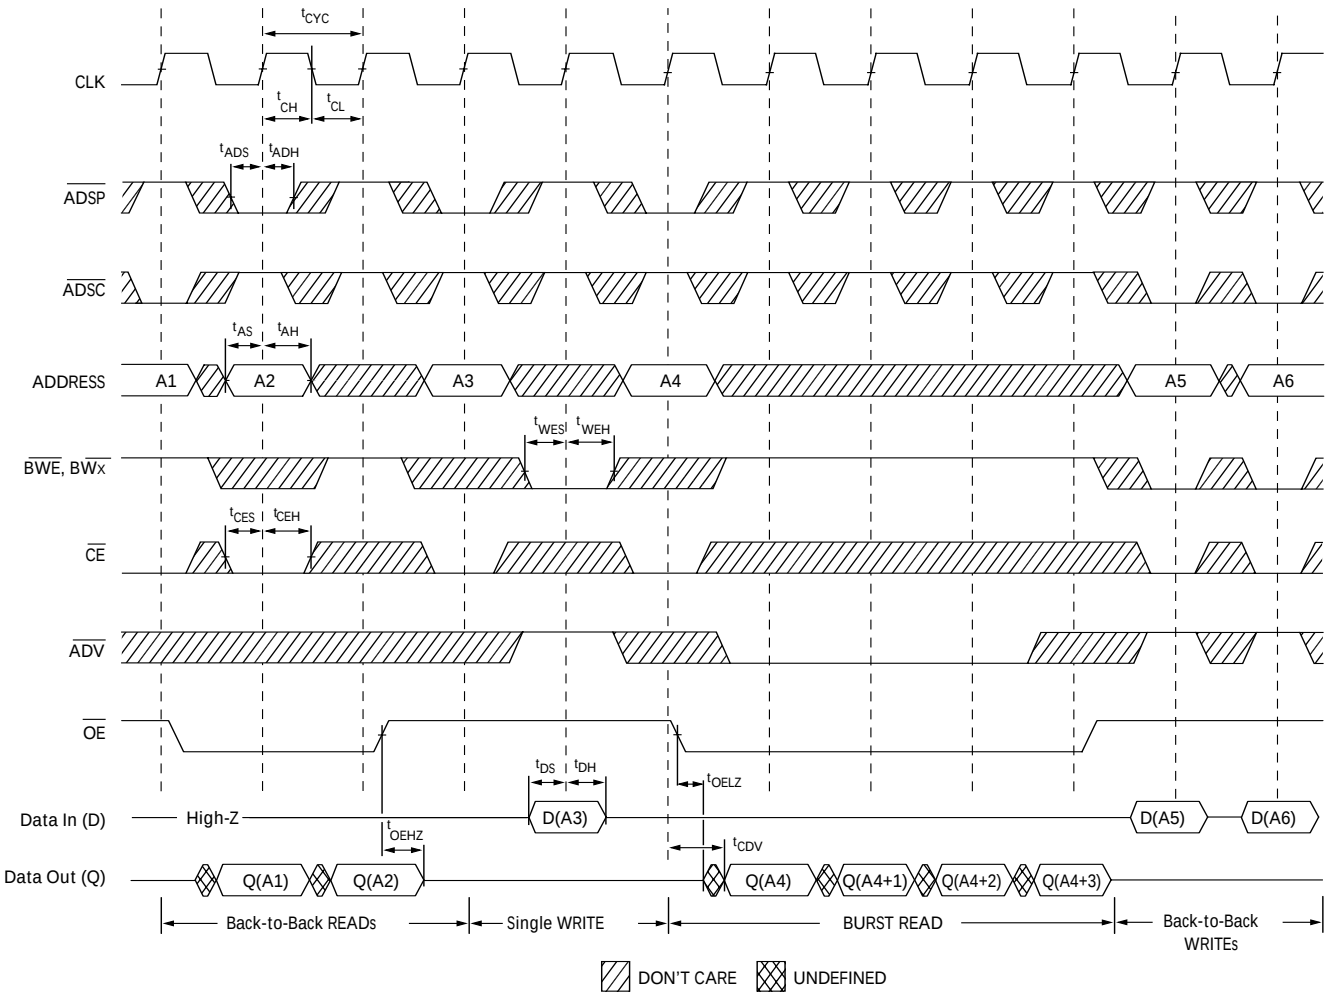


Notes:

22. Full width write can be initiated by either $\overline{GW}$ LOW; or by $\overline{GW}$ HIGH, $\overline{BWE}$ LOW and $\overline{BW}_X$ LOW.

Timing Diagrams (continued)

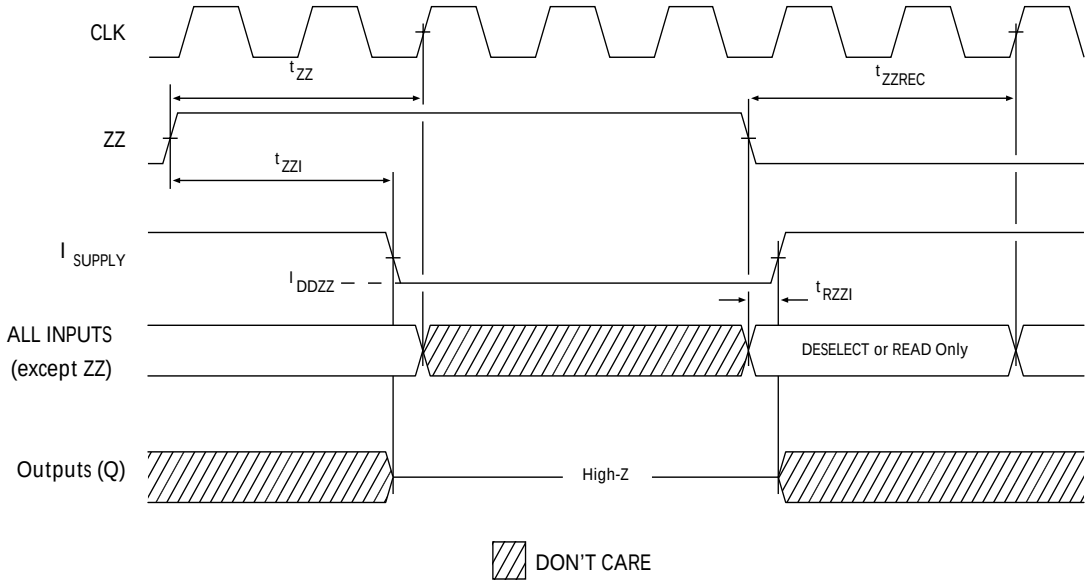
Read/Write Cycle Timing[21, 23, 24]



Note:
23. The data bus (Q) remains in high-Z following a WRITE cycle, unless a new read access is initiated by $\overline{ADSP}$ or $\overline{ADSC}$.
24. $\overline{GW}$ is HIGH.

Timing Diagrams (continued)

ZZ Mode Timing [25, 26]



Notes:
25. Device must be deselected when entering ZZ mode. See Cycle Descriptions table for all possible signal conditions to deselect the device.
26. DQs are in high-Z when exiting ZZ sleep mode.
