Features

- High Performance, Low Power AVR® 8-bit Microcontroller
- Advanced RISC Architecture
 - 124 Powerful Instructions Most Single Clock Cycle Execution
 - 32 x 8 General Purpose Working Registers
 - Fully Static Operation
 - Up to 8 MIPS Throughput at 8 MHz
- High Endurance Non-volatile Memory Segments
 - 16K/32K Bytes of In-System Self-Programmable Flash (ATmega16HVB/32HVB)
 - 512/1K Bytes EEPROM
 - 1K/2K Bytes Internal SRAM
 - Write/Erase Cycles 10,000 Flash/100,000 EEPROM
 - Data retention: 20 years at 85°C/100 years at 25°C⁽¹⁾
 - Optional Boot Code Section with Independent Lock Bits In-System Programming by On-chip Boot Program
 True Read-While-Write Operation
 - Programming Lock for Software Security
- Battery Management Features
 - Two, three or Four Cells in Series
 - High-current Protection (Charge and Discharge)
 - Over-current Protection (Charge and Discharge)
 - Short-circuit Protection (Discharge)
 - High Voltage Outputs to Drive N-Channel Charge/Discharge FETs
 - High Voltage Output to drive P-Channel Precharge FET
 - Integrated Cell Balancing FETs
- Peripheral Features
 - Two configurable 8- or 16-bit Timers with Separate Prescaler, Optional Input Capture (IC), Compare Mode and CTC
 - SPI Serial Programmable Interface
 - 12-bit Voltage ADC, Six External and One Internal ADC Input
 - High Resolution Coulomb Counter ADC for Current Measurements
 - TWI Serial Interface for SM-Bus
 - Programmable Watchdog Timer
- Special Microcontroller Features
 - debugWIRE On-chip Debug System
 - In-System Programmable via SPI ports
 - Power-on Reset
 - On-chip Voltage Regulator with Short-circuit Monitoring Interface
 - External and Internal Interrupt Sources
 - Sleep Modes: Idle, ADC Noise Reduction, Power-save, and Power-off
- Additional Secure Authentication Features available only under NDA
- Packages
 - 44-lead TSSOP
- Operating Voltage: 4 25V
- Maximum Withstand Voltage (High-voltage pins): 35V
- Temperature Range: -30°C to 85°C
- Speed Grade: 1-8 MHz

ATmega16HVB ATmega32HVB

Advance Information

Summary

1. Pin Configurations

1.1 TSSOP

Figure 1-1. TSSOP - pinout ATmega16HVB/32HVB

1.2 Pin Descriptions

1.2.1 VFET

High voltage supply pin. This pin is used as supply for the internal voltage regulator, described in "Voltage Regulator" on page 132.

1.2.2 VCC

Digital supply voltage. Normally connected to VREG.

1.2.3 **VREG**

Output from the internal Voltage Regulator. Used for external decoupling to ensure stable regulator operation. For details, see "Voltage Regulator" on page 132.

1.2.4 VREF

Internal Voltage Reference for external decoupling. For details, see "Voltage Reference and Temperature Sensor" on page 124.

1.2.5 VREFGND

Ground for decoupling of Internal Voltage Reference. For details, see "Voltage Reference and Temperature Sensor" on page 124. Do not connect to GND or SGND on PCB.

1.2.6 GND

Ground

1.2.7 Port A (PA3..PA0)

Port A serves as a low-voltage 4-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega16HVB/32HVB as listed in "Alternate Functions of Port A" on page 76.

1.2.8 Port B (PB7..PB0)

Port B is a low-voltage 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega16HVB/32HVB as listed in "Alternate Functions of Port B" on page 77.

1.2.9 Port C (PC5)

Port C (PC5) is a high voltage Open Drain output port. Port C serves the functions of various special features of the ATmega16HVB/32HVB as listed in "Alternate Functions of Port C" on page 67.

1.2.10 Port C (PC4..PC0)

Port C is a 5-bit high voltage Open Drain bi-directional I/O port. Port C serves the functions of various special features of the ATmega16HVB/32HVB as listed in "Alternate Functions of Port C" on page 67.

1.2.11 OC/OD

High voltage output to drive Charge/Discharge. For details, see "FET Driver" on page 147.

1.2.12 PI/NI

Filtered positive/negative input from external current sense resistor, used to by the Coulomb Counter ADC to measure charge/discharge currents flowing in the battery pack. For details, see "Coulomb Counter - Dedicated Fuel Gauging Sigma-delta ADC" on page 110.

1.2.13 PPI/NNI

Unfiltered positive/negative input from external current sense resistor, used by the battery protection circuit, for over-current and short-circuit detection. For details, see "Battery Protection" on page 135.

1.2.14 NV/PV1/PV2/PV3/PV4

NV, PV1, PV2, PV3, and PV4 are the inputs for battery cells 1, 2, 3 and 4, used by the Voltage ADC to measure each cell voltage. For details, see "Voltage ADC – 7-channel General Purpose 12-bit Sigma-Delta ADC" on page 118.

1.2.15 PVT

Defines the source voltage level for the Charge FET driver. For details, see "FET Driver" on page 147.

1.2.16 BATT

Input for detecting when a charger is connected. Defines the source voltage level for the Discharge FET driver. For details, see "FET Driver" on page 147.

1.2.17 **RESET/dw**

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 11 on page 38. Shorter pulses are not guaranteed to generate a reset. This pin is also used as debugWIRE communication pin.

2. Overview

The ATmega16HVB/32HVB is a monitoring and protection circuit for 3 and 4-cell Li-ion applications with focus on high security/authentication, low cost and high utilization of the cell energy. The device contains secure authentication features as well as autonomous battery protection during charging and discharging. The External Protection Input can be used to implement other battery protection mechanisms using external components, e.g. protection against chargers with too high charge voltage can be easily implemented with a few low cost passive components. The feature set makes the ATmega16HVB/32HVB a key component in any system focusing on high security, battery protection, high system utilization and low cost.

Figure 2-1. Block Diagram

ATmega16HVB/32HVB provides the necessary redundancy on-chip to make sure that the battery is protected in critical failure modes. The chip is specifically designed to provide safety for the battery cells in case of pin shorting, loss of power (either caused by battery pack short or V_{CC}

short), illegal charger connection or software runaway. This makes ATmega16HVB/32HVB the ideal 1-chip solution for applications with focus on high safety.

The ATmega16HVB/32HVB features an integrated voltage regulator that operates at a wide range of input voltages, 4 - 25 volts. This voltage is regulated to a constant supply voltage of nominally 3.3 volts for the integrated logic and analog functions. The regulator capabilities, combined with a extremely low power consumption in the power saving modes, greatly enhances the cell energy utilization compared to existing solutions.

The chip utilizes Atmel's patented Deep Under-voltage Recovery (DUVR) mode that supports pre-charging of deeply discharged battery cells without using a separate Pre-charge FET. Optionally, Pre-charge FETs are supported for integration into many existing battery charging schemes.

The battery protection monitors the charge and discharge current to detect illegal conditions and protect the battery from these when required. A 12-bit Voltage ADC allows software to monitor each cell voltage individually with high accuracy. The ADC also provides one internal input channel to measure on-chip temperature and two input channels intended for external thermistors. An 18-bit ADC optimized for Coulomb Counting accumulates charge and discharge currents and reports accumulated current with high resolution and accuracy. It can also be used to provide instantaneous current measurements with 13 bit resolution. Integrated Cell Balancing FETs allow cell balancing algorithms to be implemented in software.

The MCU provides the following features: 16K/32K bytes of In-System Programmable Flash with Read-While-Write capabilities, 512/1K bytes EEPROM, 1K/2K bytes SRAM. 32 general purpose working registers, 12 general purpose I/O lines, 5 general purpose high voltage open drain I/O lines, one general purpose super high voltage open drain output, debugWIRE for On-chip debugging and SPI for In-system Programming, a SM-Bus compliant TWI module, two flexible Timer/Counters with Input Capture and compare modes.

Internal and external interrupts, a 12-bit Sigma Delta ADC for voltage and temperature measurements, a high resolution Sigma Delta ADC for Coulomb Counting and instantaneous current measurements, integrated cell balancing FETs, Additional Secure Authentication Features, an autonomous Battery Protection module, a programmable Watchdog Timer with internal Oscillator, and software selectable power saving modes.

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The device is manufactured using Atmel's high voltage high density non-volatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed In-System, through an SPI serial interface, by a conventional non-volatile memory programmer or by an On-chip Boot program running on the AVR core. The Boot program can use any interface to down-load the application program in the Application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable-Flash and highly accurate analog front-end in a monolithic chip.

The Atmel ATmega16HVB/32HVB is a powerful microcontroller that provides a highly flexible and cost effective solution. It is part of the AVR Smart Battery family that provides secure

authentication, highly accurate monitoring and autonomous protection for Lithium-ion battery cells.

The ATmega16HVB/32HVB AVR is supported with a full suite of program and system development tools including: C Compilers, Macro Assemblers, Program Debugger/Simulators, and Onchip Debugger.

2.1 Comparison Between ATmega16HVB and ATmega32HVB

The ATmega16HVB and ATmega32HVB differ only in memory size for Flash, EEPROM and internal SRAM. Table 2-1 summarizes the different configuration for the two devices.

Table 2-1. Configuration summary

Device	Flash	EEPROM	SRAM
ATmega16HVB	16K	512	1K
ATmega32HVB	32K	1K	2K

3. Disclaimer

All Min, Typ and Max values contained in this datasheet are preliminary estimates based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Final values will be available after the device is characterized.

4. Resources

A comprehensive set of development tools, application notes and datasheets are available for download on http://www.atmel.com/avr.n1

5. Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

Notes:

- 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
- 2. I/O registers within the address range \$00 \$1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
- 3. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
- 4. When using the I/O specific commands IN and OUT, the I/O addresses \$00 \$3F must be used. When addressing I/O registers as data space using LD and ST instructions, \$20 must be added to these addresses. The ATmega16HVB/32HVB is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from \$60 \$FF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.

7. Instruction Set Summary

Mnemonics	Operands	Description	Operation	Flags	#Clocks
ARITHMETIC AND I	LOGIC INSTRUCTIONS	S			
ADD	Rd, Rr	Add two Registers	$Rd \leftarrow Rd + Rr$	Z,C,N,V,H	1
ADC	Rd, Rr	Add with Carry two Registers	$Rd \leftarrow Rd + Rr + C$	Z,C,N,V,H	1
ADIW	Rdl,K	Add Immediate to Word	Rdh:Rdl ← Rdh:Rdl + K	Z,C,N,V,S	2
SUB	Rd, Rr	Subtract two Registers	Rd ← Rd - Rr	Z,C,N,V,H	1
SUBI	Rd, K	Subtract Constant from Register	$Rd \leftarrow Rd - K$	Z,C,N,V,H	1
SBC	Rd, Rr	Subtract with Carry two Registers	$Rd \leftarrow Rd - Rr - C$	Z,C,N,V,H	1
SBCI	Rd, K	Subtract with Carry Constant from Reg.	Rd ← Rd - K - C	Z,C,N,V,H	1
SBIW	Rdl,K	Subtract Immediate from Word	Rdh:Rdl ← Rdh:Rdl - K	Z,C,N,V,S	2
AND	Rd, Rr	Logical AND Registers	Rd ← Rd • Rr	Z,N,V	1
ANDI	Rd, K	Logical AND Register and Constant	$Rd \leftarrow Rd \bullet K$	Z,N,V	1
OR	Rd, Rr	Logical OR Registers	Rd ← Rd v Rr	Z,N,V	1
ORI EOR	Rd, K	Logical OR Register and Constant	$Rd \leftarrow Rd \vee K$	Z,N,V	1
	Rd, Rr Rd	Exclusive OR Registers	Rd ← Rd ⊕ Rr	Z,N,V Z,C,N,V	1
COM NEG	Rd	One's Complement Two's Complement	$Rd \leftarrow 0xFF - Rd$ $Rd \leftarrow 0x00 - Rd$	Z,C,N,V Z,C,N,V,H	1
SBR	Rd,K	Set Bit(s) in Register	$Rd \leftarrow 0 \times 00 - Ru$ $Rd \leftarrow Rd \vee K$	Z,N,V	1
CBR	Rd,K	Clear Bit(s) in Register	$Rd \leftarrow Rd \bullet (0xFF - K)$	Z,N,V	1
INC	Rd	Increment	$Rd \leftarrow Rd + 1$	Z,N,V	1
DEC	Rd	Decrement	$Rd \leftarrow Rd + 1$ $Rd \leftarrow Rd - 1$	Z,N,V	1
TST	Rd	Test for Zero or Minus	Rd ← Rd • Rd	Z,N,V	1
CLR	Rd	Clear Register	Rd ← Rd ⊕ Rd	Z,N,V	1
SER	Rd	Set Register	Rd ← 0xFF	None	1
MUL	Rd, Rr	Multiply Unsigned	$R1:R0 \leftarrow Rd \times Rr$	Z,C	2
MULS	Rd, Rr	Multiply Signed	$R1:R0 \leftarrow Rd \times Rr$	Z,C	2
MULSU	Rd, Rr	Multiply Signed with Unsigned	R1:R0 ← Rd x Rr	Z,C	2
FMUL	Rd, Rr	Fractional Multiply Unsigned	$R1:R0 \leftarrow (Rd \times Rr) << 1$	Z,C	2
FMULS	Rd, Rr	Fractional Multiply Signed	R1:R0 ← (Rd x Rr) << 1	Z,C	2
FMULSU	Rd, Rr	Fractional Multiply Signed with Unsigned	R1:R0 ← (Rd x Rr) << 1	Z,C	2
BRANCH INSTRUC	TIONS				
RJMP	k	Relative Jump	PC ← PC + k + 1	None	2
IJMP		Indirect Jump to (Z)	PC ← Z	None	2
JMP	k	Direct Jump	PC ← k	None	3
