

YUV-to-RGB digital-to-analog converter Rev. 01 — 29 June 2004

Product data sheet

General description 1.

The SAF7167AHW is a mixed-mode designed IC containing a video data path, keying control block, analog mixer, and a voltage output amplifier, capable of converting digital video data to analog RGB video, and then mixing video and external analog RGB inputs.

The video data path contains a data re-formatter, YUV-to-RGB colour space matrix as well as triple DACs for video data processing. An analog mixer performs multiplexing between DAC outputs of the video path and external analog RGB inputs.

The final analog outputs are buffered with built-in voltage output amplifiers to provide the direct driving capability for a 150 Ω load. See the overall block diagram.

The operation of SAF7167AHW is controlled via the I²C-bus.

2. **Features**

- On-chip mixing of digital video data and analog RGB signals
- Supports video input format of YUV 4 : 2 : 2, 4 : 1 : 1, 2 : 1 : 1 and RGB 5 : 6 : 5
- Video input rate up to 66 MHz
- Allows for both binary and twos complement video input data
- Triple 8-bit DACs for video output
- Built-in voltage output amplifier
- Provides keying control with external key and internal 8-bit, 2 × 8-bit and 3 × 8-bit pixel colour key
- Programmable via the l²C-bus
- 5 V CMOS device; HTQFP48 package.

7. Functional description

The SAF7167AHW contains a video data path, 3 analog mixers and voltage output amplifiers for the RGB channels respectively, a keying control block as well as an I²C-bus control block.

7.1 Video data path

The video data path includes a video data re-formatter, a YUV-to-RGB colour space conversion matrix, and triple 8-bit DACs.

7.1.1 Re-formatter

The re-formatter de-multiplexes the different video formats YUV 4:1:1, 4:2:2 or 2:1:1 to internal YUV 4:4:4, which can then be processed by the RGB matrix. The pixel byte sequences of those video input formats are shown in Table 4 to Table 7.

RGB data	ı 0	1	2	3				

For RGB 5 : 6 : 5 video inputs, the video data are just directly bypassed to triple DACs.

The input video data can be selected to either twos complement (I^2C -bus bit DRP = 0) or binary offset (I^2C -bus bit DRP = 1). The video input format is selected by I^2C -bus bits FMTC[1:0].

The rising edge of HREF input defines the start of active video data. When HREF is inactive, the video output will be blanked.

7.1.2 YUV-to-RGB matrix

The matrix converts YUV data, in accordance with ITU-R BT.601, to RGB data with approximately 1.5 LSB deviation to the theoretical values for 8-bit resolution.

7.1.3 Triple 8-bit DACs

Three identical DACs for R, G and B video outputs are designed with voltage-drive architecture to provide high-speed operation of up to 66 MHz conversion data rate. Pin $C_REF(H)$ is provided to allow for one external de-coupling capacitor to be connected between the internal reference voltage source and ground.

7.2 Analog mixers and keying control

The analog mixers are controlled to switch between the outputs from the video DACs and analog RGB inputs by a keying signal. The analog RGB inputs need to interface with analog mixers in the way of DC-coupling, also these RGB inputs are limited to RGB signals without a sync level pedestal. The keying control can be enabled by setting I²C-bus bit KEN = 1. Two kinds of keying are possible to generate: one is external key (from EXTKEY pin when KMOD[2:0] are all logic 0), and the other is the internal pixel colour key (when KMOD[2:0] are not all logic 0) generated by comparing the input pixel data with the internal I²C-bus register value KD[7:0]. Controlled by KMOD[2:0] bits, there are 4 ways to compare the pixel data (see Table 8).

YUV-to-RGB digital-to-analog converter

Table 8: KMOD[2:0]		
KMOD[2:0]	Pixel type	Remark
100	8-bit pixel	pseudo colour mode
101	2×8 -bit pixel	high colour mode 1 with pixels given at both rising and falling edges of PCLK
110	2×8 -bit pixel	high colour mode 2 with pixels given only at rising edges of PCLK
111	3×8 -bit pixel	true colour mode

Since only one control register KD[7:0] provides the data value for pixel data comparison, when at 2×8 -bit or 3×8 -bit pixel input modes, it is presumed that all input bytes (lower, middle or higher) of each pixel must be the same as KD[7:0] in order to make graphics colour key active.

The polarity of EXTKEY can be selected with KINV. With KINV = 0, EXTKEY = HIGH switches analog mixers to select DAC outputs. Before the internal keying signal switches the analog multiplexers, it can be further delayed up to 7 PCLK cycles with the control bits KDLY[2:0].

7.3 Voltage output amplifiers

Before the analog input enters the analog mixers, it passes through voltage output amplifiers. Level shifters are used internally to provide an offset of 0.2 V and an amplifier gain of 2 for analog inputs to match with the output levels from DACs. After buffering with voltage output amplifiers, the final RGB outputs can drive a 150 Ω load directly (25 Ω internal resistor, 47 Ω external serial resistor, and 75 Ω load resistor) at the monitor side (see Figure 9).

The output voltage level of DAC ranges from the lowest level 0.2 V (zero code) to the highest level 1.82 V (all one code).

With the digital input YUV video data in accordance with ITU-R BT.601, the RGB output of 8-bit DAC actually ranges from the 16th step (black) to the 235th step (white). Therefore, after the voltage divider with external serial resistor and monitor load resistor, the output voltage range to a monitor is approximately 0.7 V (p-p).

7.4 I²C-bus control

Only one control byte is needed for the SAF7167AHW. The I²C-bus format is shown in Table 9.

Table 9: I²C-bus format

9. Thermal characteristics

Table 13: Thermal characteristics

Symbol	Parameter	Conditions	Тур	Unit
R _{th(j-a)}	thermal resistance from junction to ambient	in free air	34 <mark>[1]</mark>	K/W

[1] The overall R_{th(j-a)} value can vary depending on the board layout. To minimize the effective R_{th(j-a)} all power and ground pins must be connected to the power and ground layers directly. An ample copper area direct under the SAF7167AHW with a number of through-hole plating, which connect to the ground layer (four-layer board: second layer), can also reduce the effective R_{th(j-a)}. Please do not use any solder-stop varnish under the chip. In addition the usage of soldering glue with a high thermal conductance after curing is recommended.

YUV-to-RGB digital-to-analog converter

14. Soldering

14.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

14.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 °C to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA, HTSSON..T and SSOP..T packages
 - for packages with a thickness \geq 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

14.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is preferred to be parallel to the transport direction of the printed-circuit board;

9397 750 12667

YUV-to-RGB digital-to-analog converter

- smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

• For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 seconds to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

14.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 $^{\circ}$ C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 seconds to 5 seconds between 270 $^\circ C$ and 320 $^\circ C.$

14.5 Package related soldering information

Table 16:	Suitability of surface mount IC packages for wave and reflow soldering method	ds
-----------	---	----

Package [1]	Soldering method			
	Wave	Reflow ^[2]		
BGA, HTSSONT ^[3] , LBGA, LFBGA, SQFP, SSOPT ^[3] , TFBGA, USON, VFBGA	not suitable	suitable		
DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable ^[4]	suitable		
PLCC ^[5] , SO, SOJ	suitable	suitable		
LQFP, QFP, TQFP	not recommended ^{[5] [6]}	suitable		
SSOP, TSSOP, VSO, VSSOP	not recommended [7]	suitable		
CWQCCNL ^[8] , PMFP ^[9] , WQCCNL ^[8]	not suitable	not suitable		

 For more detailed information on the BGA packages refer to the (LF)BGA Application Note (AN01026); order a copy from your Philips Semiconductors sales office.

- [2] All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods.
- [3] These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding 217 °C ± 10 °C measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.

YUV-to-RGB digital-to-analog converter

- [4] These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- [5] If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- [6] Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- [7] Wave soldering is suitable for SSOP, TSSOP, VSO and VSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- [8] Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
- [9] Hot bar soldering or manual soldering is suitable for PMFP packages.

16. Data sheet status

Level	Data sheet status [1]	Product status [2] [3]	Definition
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
111	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

[1] Please consult the most recently issued data sheet before initiating or completing a design.

[2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL http://www.semiconductors.philips.com.

[3] For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

17. Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

18. Disclaimers

Life support — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors

20. Contact information

customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

19. Licenses

Purchase of Philips I²C-bus components

Purchase of Philips I²C-bus components conveys a license under the Philips' I²C-bus patent to use the components in the I²C-bus system provided the system conforms to the I²C-bus specification defined by Koninklijke Philips Electronics N.V. This specification can be ordered using the code 9398 393 40011.
