FUNCTION DESCRIPTION

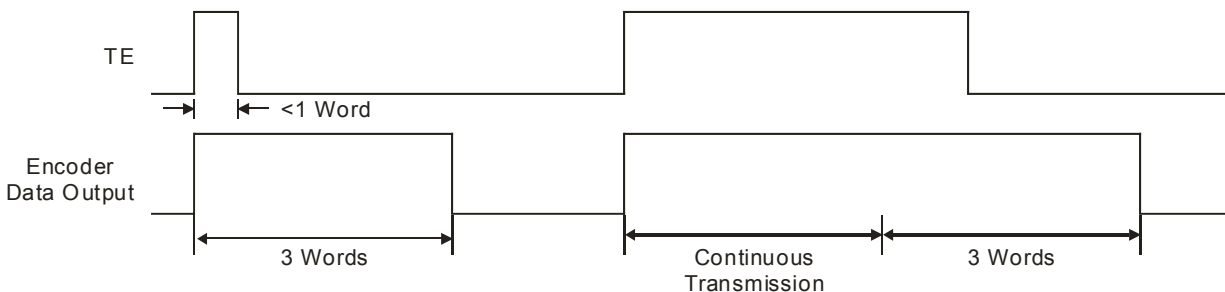

OPERATION

Transmission is enabled by setting any one of the data pins -- D12 to D15 to "HIGH" (for PT2607 version) or by setting the TE (for PT2607B and PT2607C versions).

For PT2607 version, when transmission enable signals from Pins -- D12 to D15 -- are received, PT2607 begins a three-word transmission cycle. This three-word transmission cycle will continue as long as the transmission enable (D12 to D15) is held "HIGH". When D12 to D15 goes to "LOW" (that is, the transmission enable become "LOW"), the encoder output completes its final three-word transmission cycle and then stops. Please refer to the diagram below.

For PT2607B & PT2607C versions, when transmission enable signals from TE is received, PT2607B/PT2607C begins a three-word transmission cycle. This three-word transmission cycle will continue as long as the transmission enable is held "HIGH". When TE goes to "LOW" (that is, the transmission enable become "LOW"), the encoder output completes its final three-word transmission cycle and then stops. Please refer to the diagram below.

PT2607 CODE WORD

A Code Word consists of a Start Bit, 12 Address Bits and 6 Data Bits. Please refer to the diagram below.

PT2607B & PT2607C CODE WORD

A Code Word consists of a Start Bit, 10 Address Bits and 8 Address/ Data Bits. Please refer to the diagram below.

ADDRESS BITS & DATA BITS WAVEFORM

where:

α = oscillating clock period

The Data Input Floating State is interpreted as "LOW" by the decoders since the decoder output only provides for two states.

START BIT

PRESET ADDRESS/DATA PROGRAMMING

Each address or data pin can be preset to “High”, “Low” or “Floating”. When a transmission enable signal is applied, the encoder scans and transmits serially the status of the 18 bits of address/data in the order of A0 to D17.

OPERATION FLOWCHART

Notes:

1. D12 to D15 is transmission enable pins of PT2607 version.
2. TE is the transmission enable pin of PT2607B and PT2607C versions.

OSCILLATION FREQUENCY VS. SUPPLY VOLTAGE

The recommended oscillation frequency of PT2607 ICs must be equal to the oscillation frequency of the decoder. That is, $F_{osc}(\text{decoder}) = F_{osc}(\text{encoder})$.
