

Precision Low Noise JFET Operational Amplifiers

ISL28110, ISL28210

The ISL28110, ISL28210, are single and dual JFET amplifiers featuring low noise, high slew rate, low input bias current and offset voltage, making them the ideal choice for high impedance applications where precision and low noise are important. The combination of precision, low noise, and high speed combined with a small footprint provides the user with outstanding value and flexibility relative to similar competitive parts.

Applications for these amplifiers include precision medical and analytical instrumentation, sensor conditioning, precision power supply controls, industrial controls and photodiode amplifiers.

The ISL28110 single amplifier is available in the 8 Ld SOIC, TDFN, and MSOP packages. The ISL28210 dual amplifier is available in the 8 Ld SOIC and TDFN packages. All devices are offered in standard pin configurations and operate over the extended temperature range from -40°C to +125°C.

Features

- Wide Supply Range. 9V to 40V
- Low Voltage Noise 6nV/√Hz
- Input Bias Current 2pA
- High Slew Rate. 23V/μs
- High Bandwidth 12.5MHz
- Low Input Offset 300μV, Max
- Offset Drift Grade C 10μV/°C
- Low Current Consumption 2.55mA
- Operating Temperature Range . . . -40°C to +125°C
- Small Package Offerings in Single, and Dual
- Pb-Free (RoHS compliant)

Applications* (see page 22)

- Precision Instruments
- Photodiode Amplifiers
- High Impedance Buffers
- Medical Instrumentation
- Active Filter Blocks
- Industrial Controls

Typical Application

BASIC APPLICATION CIRCUIT - PHOTODIODE AMPLIFIER

Input Bias Current vs Common Mode Input Voltage

NOTES:

1. Add "-T*" suffix for tape and reel. Please refer to [TB347](#) for details on reel specifications..
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [ISL28110](#), [ISL28210](#). For more information on MSL please see techbrief [TB363](#).

Applications Information

Functional Description

The ISL28110 and ISL28210 are single and dual 12.5 MHz precision JFET input op amps. These devices are fabricated in the PR40 Advanced Silicon-on-Insulator (SOI) bipolar-JFET process to ensure latch-free operation. The precision JFET input stage provides low input offset voltage (300µV max @ +25°C), low input voltage noise (6nV/√Hz), and input current noise that is very low with virtually no 1/f component. A high current complementary NPN/PNP emitter-follower output stage provides high slew rate and maintains excellent THD+N performance into heavy loads (0.0003% @ 10V_{p-p} @ 1kHz into 600Ω).

Operating Voltage Range

The devices are designed to operate over the 9V (±4.5V) to 40V (±20V) range and are fully characterized at 10V (±5V) and 30V (±15V). The JFET input stage maintains high impedance over a maximum input differential

voltage range of ±33V. Internal ESD protection diodes clamp the non-inverting and inverting inputs to one diode drop above and below the V+ and V- the power supply rails ("Pin Descriptions" on page 2, CIRCUIT 1).

Input ESD Diode Protection

The JFET gate is a reverse-biased diode with >33V reverse breakdown voltage which enables the device to function reliably in large signal pulse applications without the need for anti-parallel clamp diodes required on MOSFET and most bipolar input stage op amps. No special input signal restrictions are needed for power supply operation up to ±15V, and input signal distortion caused by nonlinear clamps under high slew rate conditions are avoided. For power supply operation greater than ±16V (>32V), the internal ESD clamp diodes alone cannot clamp the maximum input differential signal to the power supply rails without the risk of exceeding the 33V breakdown of the JFET gate. Under these conditions, differential input voltage limiting is necessary to prevent damage to the JFET input stage.

In applications where one or both amplifier input terminals are at risk of exposure to voltages beyond the supply rails, current limiting resistors may be needed at each input terminal (see Figure 41 R_{IN+} , R_{IN-}) to limit current through the power supply ESD diodes to 20mA.

FIGURE 41. INPUT ESD DIODE CURRENT LIMITING

JFET Input Stage Performance

The ISL28110, ISL28210 JFET input stage has the linear gain characteristics of the MOSFET but can operate at high frequency with much lower noise. The reversed-biased gate PN gate junction has significantly lower gate capacitance than the MOSFET, enabling input slew rates that rival op amps using bipolar input stages. The added advantage for high impedance, precision amplifiers is the lack of a significant 1/f component of current noise (Figures 13, 14) as there is virtually no gate current.

The input stage JFETs are bootstrapped to maintain a constant JFET drain to source voltage which keeps the JFET gate currents and input stage frequency response nearly constant over the common mode input range of the device. These enhancements provide excellent CMRR, AC performance and very low input distortion over a wide temperature range. The common mode input performance for offset voltage and bias current is shown in Figure 42. Note that the input bias current remains low even after the maximum input stage common mode voltage is exceeded (as indicated by the abrupt change in input offset voltage).

FIGURE 42. INPUT OFFSET VOLTAGE AND BIAS CURRENT vs COMMON MODE INPUT VOLTAGE

Output Drive Capability

The complementary bipolar emitter follower output stage features low output impedance (Figure 40) and is capable of substantial current drive over the full temperature range (Figures 27, 28) while driving the output voltage close to the supply rails. The output current is internally limited to approximately $\pm 50\text{mA}$ at $+25^\circ\text{C}$. The amplifiers can withstand a short circuit to either rail as long as the power dissipation limits are not exceeded. This applies to only 1 amplifier at a time for the dual op amp. Continuous operation under these conditions may degrade long term reliability.

Output Phase Reversal

Output phase reversal is a change of polarity in the amplifier transfer function when the input voltage exceeds the supply voltage. The ISL28110 and ISL28210 are immune to output phase reversal, out to 0.5V beyond the rail ($V_{ABS\ MAX}$) limit. Beyond these limits, the device is still immune to reversal to 1V beyond the rails but damage to the internal ESD protection diodes can result unless these input currents are limited.

Maximizing Dynamic Signal Range

The amplifiers maximum undistorted output swing is a figure of merit for precision, low distortion applications. Audio amplifiers are a good example of amplifiers that require low noise and low signal distortion over a wide output dynamic range. When these applications operate from batteries, raising the amplifier supply voltage to overcome poor output voltage swing has the penalty of increased power consumption and shorter battery life. Amplifiers whose input and output stages can swing closest to the power supply rails while providing low noise and undistorted performance, will provide maximum useful dynamic signal range and longer battery life.

Rail-to-rail input and output (RRIO) amplifiers have the highest dynamic signal range but their added complexity degrades input noise and amplifier distortion. Many contain two input pairs, one pair operating to each supply rail. The trade-offs for these are increased input noise and distortion caused by non-linear input bias current and capacitance when amplifying high impedance sources. Their rail-to-rail output stages swing to within a few millivolts of the rail, but output impedances are high so that their output swing decreases and distortion increases rapidly with increasing load current. At heavy load currents the maximum output voltage swing of RRO op amps can be lower than a good emitter follower output stage.

The ISL28110 and ISL28210 low noise input stage and high performance output stage are optimized for low THD+N into moderate loads over the full -40°C to $+125^\circ\text{C}$ temperature range. Figures 19 and 20 show the 1kHz THD+N unity gain performance vs output voltage swing at load resistances of 2k Ω and 600 Ω . Figure 43 shows the unity-gain THD+N performance driving 600 Ω from $\pm 5\text{V}$ supplies.

FIGURE 43. UNITY-GAIN THD+N vs OUTPUT VOLTAGE vs TEMPERATURE AT $V_S = \pm 5V$ FOR 600Ω LOAD

Power Dissipation

It is possible to exceed the $+150^{\circ}C$ maximum junction temperatures under certain load and power supply conditions. It is therefore important to calculate the maximum junction temperature (T_{JMAX}) for all applications to determine if power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related using Equation 1:

$$T_{JMAX} = T_{MAX} + \theta_{JA} \times PD_{MAXTOTAL} \quad (EQ. 1)$$

where:

- $PD_{MAXTOTAL}$ is the sum of the maximum power dissipation of each amplifier in the package (PD_{MAX})
- PD_{MAX} for each amplifier can be calculated using Equation 2:

$$PD_{MAX} = V_S \times I_{qMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L} \quad (EQ. 2)$$

where:

- T_{MAX} = Maximum ambient temperature
- θ_{JA} = Thermal resistance of the package
- PD_{MAX} = Maximum power dissipation of 1 amplifier
- V_S = Total supply voltage
- I_{qMAX} = Maximum quiescent supply current of 1 amplifier
- V_{OUTMAX} = Maximum output voltage swing of the application
- R_L = Load resistance

ISL28110 and ISL28210 SPICE Model

Figure 44 shows the SPICE model schematic and Figure 45 shows the net list for the SPICE model. The model is a simplified version of the actual device and simulates important AC and DC parameters. AC parameters incorporated into the model are: 1/f and flatband noise voltage, Slew Rate, CMRR, Gain and Phase. The DC parameters are I_{OS} , total supply current and output voltage swing. The model uses typical parameters given in the “Electrical Specifications” Table beginning on page 4. The AVOL is adjusted for 125dB with the dominant pole at 7Hz. The CMRR is set 120dB, $f = 280kHz$. The input stage models the actual device to present an accurate AC representation. The model is configured for ambient temperature of $+25^{\circ}C$.

Figures 46 through 59 show the characterization vs simulation results for the Noise Voltage, Closed Loop Gain vs Frequency, Small Signal 0.1V Step, Large Signal 5V Step Response, Open Loop Gain Phase, CMRR and Output Voltage Swing for $\pm 5V$ and $\pm 15V$ supplies.

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

DATE	REVISION	CHANGE
11/29/10	FN6639.1	Removed label on right side of characterization curve, Figure 46 (Input Noise Current).
11/23/10		Page 1 Updated Trademark statement Page 3 Ordering Information: Removed "coming soon" from ISL28110FBZ Page 4 Electrical Specifications: Added ISL28110 IB and IOS specs @ VS=±5V. Page 5 Electrical Specifications: Changed AVOL limits fro V/mV to dB Page 5 Electrical Specifications, Dynamic Performance, Slew Rate: Added "4V Step" to conditions; changed TYP limit from 23V/μs to 20V/μs Page 6 Electrical Specifications, Dynamic Performance, Slew Rate: Added "10V Step" to conditions; changed TYP limit from 23V/μs to 20V/μs Page 6 Electrical Specifications: Added ISL28110 IB and IOS specs @ VS= ±15V. Changed AVOL limits from V/mV to dB. Changed ts, settling time to 0.1% from 0.9μs to 1.3μs and changed ts, settling time to 0.01% from 1.2μs to 1.6μs. Page 7 Replaced Elect Spec table Notes 8 & 9 (Note 8 "Parameters with MIN and/or MAX limits are 100% tested at +25°C, unless otherwise specified. Temperature limits established by characterization and are not production tested./Note 9 Limits established by characterization and are not production tested.)" With: "Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design." Page 8 Characteristic Curves: Added ISL28110 IB vs Temperature (Fig 4) Page 8 Characteristic Curves: Added ISL28110 IOS vs Temperature (Fig 6) Pages 17-21: Added PSPICE model section
9/13/10	FN6639.0	Initial Release.

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: [ISL28110](#), [ISL28210](#)

To report errors or suggestions for this datasheet, please go to www.intersil.com/askourstaff

FITs are available from our website at <http://rel.intersil.com/reports/search.php>

For additional products, see www.intersil.com/product_tree

Intersil products are manufactured, assembled and tested utilizing ISO9000 quality systems as noted in the quality certifications found at www.intersil.com/design/quality

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use.
