Revision History

Revision 0.1 (May. 2007)
- First release.

Revision 0.2 (May. 2008)..
- change package out-line spec :
  from 12.5mm x 10.0mm
  to 12.0mm x 10.0mm

Revision 0.3 (Aug. 2008)..
- change ICC spec :
  ICC2N : 12 MA
  ICC2Ns. : 5 MA
  ICC3P : 2 MA
  ICC3Ps. : 1 MA
  ICC3N : 15 MA
  ICC5 : 120 MA

Revision 0.4 (May. 2009)..
- Add -6 Speed product

512Mb (8M×4Bank×16) Synchronous DRAM

Features

- Fully Synchronous to Positive Clock Edge
- VDD= 1.8V +/- 0.1V for 133MHz Power Supply
  VDD= 1.85V+/- 0.1V for 166MHz
- LVCMOS Compatible with Multiplexed Address
- Programmable Burst Length (B/L) - 1, 2, 4, 8 or Full Page
- Programmable CAS Latency (C/L) - 2 or 3
- Data Mask (DQM) for Read / Write Masking
- Programmable Wrap Sequence
  – Sequential (B/L = 1/2/4/8/full Page)
  – Interleave (B/L = 1/2/4/8)
- Burst Read with Single-bit Write Operation
- All Inputs are Sampled at the Rising Edge of the System Clock
- Auto Refresh and Self Refresh
- 8,192 Refresh Cycles / 64ms (7.8us)
- Partial Array Self-Refresh (PASR)
- Auto Temperature Compensated
  Self-Refresh(TCSR)
  by built-in temperature sensor
- Driver strength: normal/weak

Description

The EM48BM1684LBA is Synchronous Dynamic Random Access Memory (SDRAM) organized as 8Meg words x 4 banks by 16 bits. All inputs and outputs are synchronized with the positive edge of the clock.

The 512Mb SDRAM uses synchronized pipelined architecture to achieve high speed data transfer rates and is designed to operate at 1.8V low power memory system. It also provides auto refresh with power saving / down mode. All inputs and outputs voltage levels are compatible with LVCMOS.

Available packages:

FBGA 54B 12.0mm x 10mm x 1.2mm.

Pin Description (Simplified)

Pin	Name	Function
F2	CLK	**(System Clock)** Master clock input (Active on the positive rising edge)
G9	/CS	**(Chip Select)** Selects chip when active
F3	CKE	**(Clock Enable)** Activates the CLK when "H" and deactivates when "L". CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby.
H7,H8,J8,J7,J3, J2,H3,H2,H1,G3, H9,G2,G1	A0~A12	**(Address)** Row address (A0 to A12) is determined by A0 to A12 level at the bank active command cycle CLK rising edge. CA (CA0 to CA9) is determined by A0 to A9 level at the read or write command cycle CLK rising edge. And this column address becomes burst access start address. A10 defines the pre-charge mode. When A10= High at the pre-charge command cycle, all banks are pre-charged. But when A10= Low at the pre-charge command cycle, only the bank that is selected by BA0/BA1 is pre-charged.
G7,G8	BA0, BA1	**(Bank Address)** Selects which bank is to be active.
F8	/RAS	**(Row Address Strobe)** Latches Row Addresses on the positive rising edge of the CLK with /RAS "L". Enables row access & pre-charge.
F7	/CAS	**(Column Address Strobe)** Latches Column Addresses on the positive rising edge of the CLK with /CAS low. Enables column access.
F9	/WE	**(Write Enable)** Latches Column Addresses on the positive rising edge of the CLK with /CAS low. Enables column access.
F1/E8	UDQM/LDQM	**(Data Input/Output Mask)** DQM controls I/O buffers.
A8,B9,B8,C9,C8, D9,D8,E9,E1,D2, D1,C2,C1,B2,B1, A2	DQ0~DQ15	**(Data Input/Output)** DQ pins have the same function as I/O pins on a conventional DRAM.
A9,E7,J9/ A1,E3,J1	V_{DD}/V_{SS}	**(Power Supply/Ground)** V_{DD} and V_{SS} are power supply pins for internal circuits.
A7,B3,C7,D3/ A3,B7,C3,D7	V_{DDQ}/V_{SSQ}	**(Power Supply/Ground)** V_{DDQ} and V_{SSQ} are power supply pins for the output buffers.
E2	NC	**(No Connection)** This pin is recommended to be left No Connection on the device.

Absolute Maximum Rating

The number of clock cycles = Specified value of timing/clock period (Count Fractions as a whole number)

Recommended Power On and Initialization

The following power on and initialization sequence guarantees the device is preconditioned to each user's specific needs. (Like a conventional DRAM) During power on, all V_{DD} and V_{DDQ} pins must be built up simultaneously to the specified voltage when the input signals are held in the "NOP" state. The power on voltage must not exceed V_{DD}+0.3V on any of the input pins or V_{DD} supplies. (CLK signal started at same time)

After power on, an initial pause of 200 µs is required followed by a precharge of all banks using the precharge command.

To prevent data contention on the DQ bus during power on, it is required that the DQM and CKE pins be held high during the initial pause period. Once all banks have been precharged, the Mode Register Set Command must be issued to initialize the Mode Register. A minimum of eight Auto Refresh cycles (CBR) are also required, and these may be done before or after programming the Mode Register.

Extended Mode Register Set (EMRS)

The Extended mode register is written by asserting low on /CS, /RAS, /CAS, /WE and high on BA1 (The DDR SDRAM should be in all bank precharge with CKE already prior to writing into the extended mode register.) The state of address pins A0-A10 and BA1 in the same cycle as /CS, /RAS, /CAS, and /WE going low is written in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. High on BA0 is used for EMRS. All the other address pins except A0 and BA0 must be set to low for proper EMRS operation.

Output Drive Strength

The normal drive strength got all outputs is specified to be LV-CMOS. By setting EMRS specific parameter on A6 and A5, driving capability of data output drivers is selected.

Temperature Compensated Self-Refresh

TCSR controlled by programming in the extended mode register (EMRS). The memory automatically changes the self-refresh cycle by temperature fluctuations.

Partial Array Self Refresh

In EMRS setting ,memory array size to be refreshed during self-refresh operation is programmable in order to reduce power. Data outside the defined area will not be retained during self-refresh.

Note 7: All entries assume that CKE was active (High level) during the preceding clock cycle.

Note 8: If all banks are idle, and CKE is inactive (Low level), SDRAM will enter Power down mode. All input buffers except CKE will be disabled.

Note 9: Illegal to bank in specified states; Function may be legal in the bank indicated by Bank Address (BA), depending on the state of that bank.

Note 10: If all banks are idle, and CKE is inactive (Low level), SDRAM will enter Self refresh mode. All input buffers except CKE will be disabled.

Note 11: Illegal if t_{RCD} is not satisfied.

Note 12: Illegal if t_{RAS} is not satisfied.

Note 13: Must satisfy burst interrupt condition.

Note 14: Must satisfy bus contention, bus turn around, and/or write recovery requirements.

Note 15: Must mask preceding data which don't satisfy t_{DPL}.

Note 16: Illegal if t_{RRD} is not satisfied.
