

Automotive Quad Low Side Driver

The MC33385 is a Quad Low Side Driver fully protected switch. This device is a general purpose Low Side Driver but has been especially designed to operate in engine management application as injector driver or automotive gear box. It is interfaced directly with a microcontroller for parallel control of the load and the individual output diagnostic is done through a SPI. The diagnostic logic recognizes 4 failure types at each output stage the overcurrent, the short to GND, the openload and the over-temperature.

- RDSON of 250mΩ per Output at 25°C
- Supplied from the main 5V Vcc
- Input CMOS Compatible
- Diagnostic through SPI
- Nominal Current of 2A per Output
- Current Limitation at 3A with Automatic Turn Off
- Output Internally Clamped at 50V typ for Inductive Load Drive
- Junction to Case Thermal Resistance of 4.4°C/W
- Individual Output over Temperature Shutdown

Freescale Semiconductor, Inc.

Introduction

The device is a Quad Low Side Driver driven by four CMOS input stages. Each output power transistor is protected against short to V_{BAT} and by a zener clamp against overvoltage.

A diagnostic logic recognizes four failure types at the output stage : overcurrent, short to GND, open-load and overtemperature.

The failures are individually stored in a byte which can be read out via a serial interface (SPI).

Output Stage Control

Each of the four output stages is switched ON and OFF by an individual control line (NON-Input). The logic level of the control line is CMOS compatible. The output transistors are switched off when the inputs are not connected.

Power Transistors

Each of the four output stages has its own zener clamp. This causes a voltage limitation at the power transistors when inductive loads are switched off. Drain voltage ramp occurring when output is switched on or off, is within defined limits. Output transistors can be connected in parallel to increase current capability. In this case, the associated inputs should be connected together.

Short-Circuit and Overtemperature Protection

If the output current increases above the short current limit for a time longer than t_{SCB} or if the temperature increases above T_{OFF} then the power transistor is immediately switched off. It remains switched off until the control signal on the NON-Input is switched off and on again.

Diagnostics

Following failures at the output stage are recognized :

- Short -Circuit to V_{BAT} or overtemp..... = SCB (Highest priority)
- Short -Circuit to GND..... = SCG
- Open Load..... = OL (Lowest priority)

The SCB failure is recognized by an overcurrent (current above the short current limit) or an overtemperature.

If the current through the output stage is lower than the IOL-reference, after a filter time an OL failure will be recognized. This measurement is active while the power stage is switched on.

The SCG failure will recognize when the drain voltage is lower than the OL reference limit, while the output stage is switched off. All four outputs have an independent overtemperature detection and shutdown. All failures are stored in individual registers.

They can be read by the microprocessor via the serial interface. There is no failure detected if the powerstage control time is shorter than the filter time.

Diagnostic Interface

The communication between the microprocessor and the failure register runs via the SPI link. If there is a failure stored in the failure register, the first bit of the shift register is set to a high level. With the H/L change on the NCS pin the first bit of the diagnostic shift register will be transmitted to the SDO output. The SDO output is the serial output from the diagnostic shift register and it is tristated when the NCS pin is high. The CLK pin clocks the diagnostic shift register. New SDO data will appear on every rising edge of this pin and new SDI data will be latched on every CLK' s falling edge into the shift register. With the first positive pulse of the CLK, the failure register will be cleared. There is no bus collision at a small spike at the NCS. The CLK is always LOW while the NCS-signal is changing.

Reset

There are two different reset functions realised :

Under voltage reset : as long as the V_{CC} voltage is lower than V_{CCRES} , the power stages are switched off and the failure-register are reseted.

Reset pin : as long as the NRES-pin is low, following circuits are reseted :

- Powerstages
- Failure register

Undervoltage Protection

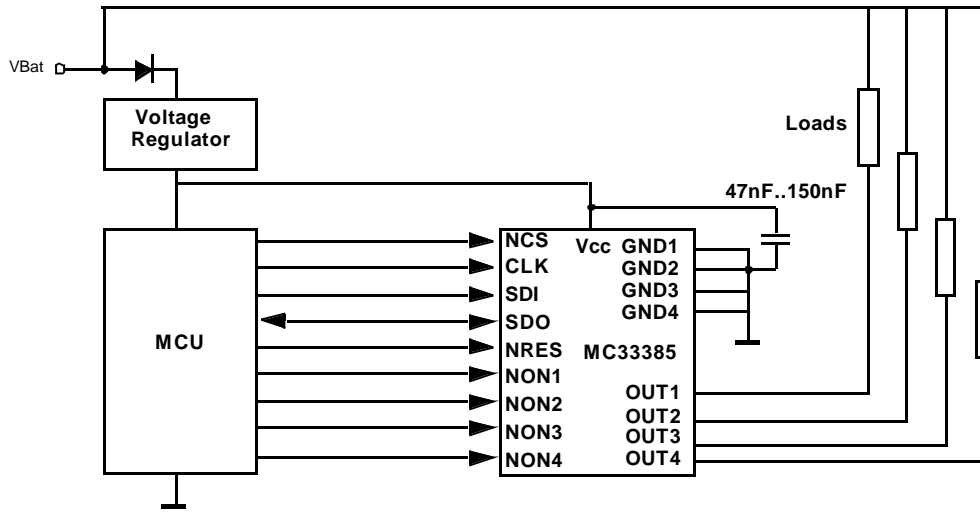

At low V_{CC} voltage, the device remains switched off even if there is a voltage ramp at the OUT pin.

Freescale Semiconductor, Inc.

This device is dedicated to automotive applications such as engine managements systems, automatic gear box... It interfaces between the microcontroller and the actuors of the system.

The loads can be only resistive or resistive and inductive such as injectors, EGR valves...etc... Following is an example of application schematic, see figure below.

Figure7- Typical Application

PINS FUNCTION DESCRIPTION

Pin No.	Function	Description
1	GND2	Ground 2
2	OUT2	Output Channel 2
3		NC
4	NON2	Input Control Signal for Channel 2
5	SDI	Serial Data Input
6	CLK	Clock Line for Serial Interface
7	NCS	Chip Select for Serial Interface
8	NON4	Input Control Signal for Channel 4
9	OUT4	Output Channel 4
10	GND4	Ground 4
11	GND3	Ground 3
12	OUT3	Output Channel 3
13	NON3	Input Control Signal for Channel 3
14	Vcc	5V Power Supply
15	NRES	Reset Input
16	SDO	Data Output of Serial Interface
17	NON1	Input Control Signal Channel 1
18		NC
19	OUT1	Output Channel 1
20	GND1	Ground 1
	Case	Connected to the PCB Ground for Thermal Purposes

CASE OUTLINES

NOTES:

1. CONTROLLING DIMENSION: MILLIMETER.
2. DIMENSIONS AND TOLERANCES PER ASME Y14.5M, 1994.
3. DATUM PLANE $\pm H$ IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING LINE.
4. DIMENSIONS D AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.150 PER SIDE. DIMENSIONS D AND E1 DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE $\pm H$.
5. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.178 TOTAL IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. DATUMS $\pm A$ AND $\pm B$ TO BE DETERMINED AT DATUM PLANE $\pm H$.
7. DIMENSION D DOES NOT INCLUDE TIEBAR PROTRUSIONS. ALLOWABLE TIEBAR PROTRUSIONS ARE 0.150 PER SIDE.
