WM8960

Stereo CODEC with 1W Stereo Class D Speaker Drivers and Headphone Drivers for Portable Audio Applications

DESCRIPTION

The WM8960 is a low power, high quality stereo codec designed for portable digital audio applications.

Stereo class D speaker drivers provide 1W per channel into 8Ω loads with a 5V supply. Low leakage, excellent PSRR and pop/click suppression mechanisms also allow direct battery connection to the speaker supply. Flexible speaker boost settings allow speaker output power to be maximised while minimising other analogue supply currents.

A highly flexible input configuration for up to three stereo sources is integrated, with a complete microphone interface. External component requirements are drastically reduced as no separate microphone, speaker or headphone amplifiers are required. Advanced on-chip digital signal processing performs automatic level control for the microphone or line input.

Stereo 24-bit sigma-delta ADCs and DACs are used with low power over-sampling digital interpolation and decimation filters and a flexible digital audio interface.

The master clock can be input directly or generated internally by an onboard PLL, supporting most commonly-used clocking schemes.

The WM8960 operates at analogue supply voltages down to 2.7V, although the digital supplies can operate at voltages down to 1.71V to save power. The speaker supply can operate at up to 5.5V, providing 1W per channel into 8Ω loads. Unused functions can be disabled using software control to save power.

The WM8960 is supplied in a very small and thin 5x5mm QFN package, ideal for use in hand-held and portable systems.

FEATURES

- DAC SNR 98dB ('A' weighted), THD -84dB at 48kHz, 3.3V
- ADC SNR 94dB ('A' weighted), THD -82dB at 48kHz, 3.3V
- Pop and click suppression
- 3D Enhancement
- Stereo Class D Speaker Driver
  - <0.1% THD with 1W per channel into 8Ω BTL speakers
  - 70dB PSRR @217Hz
  - 87% efficiency (1W output)
  - Flexible internal switching clock
- On-chip Headphone Driver
  - 40mW output power into 16Ω at 3.3V
  - Capless mode support
  - THD -75dB at 20mW, SNR 90dB with 16Ω load
- Microphone Interface
  - Pseudo differential for high noise immunity
  - Integrated low noise MICBIAS
  - Programmable ALC / Limiter & Noise Gate
- Low Power Consumption
  - 10mW headphone playback (2.7V / 1.8V supplies)
  - 20mW record and playback (2.7V / 1.8V supplies)
- Low Supply Voltages
  - Analogue 2.7V to 3.6V (Speaker supply up to 5.5V)
  - Digital core and I/O: 1.71V to 3.6V
- On-chip PLL provides flexible clocking scheme
- Sample rates: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48
- 5x5x0.9mm QFN package

APPLICATIONS

- Games consoles
- Portable media / DVD players
- Mobile multimedia

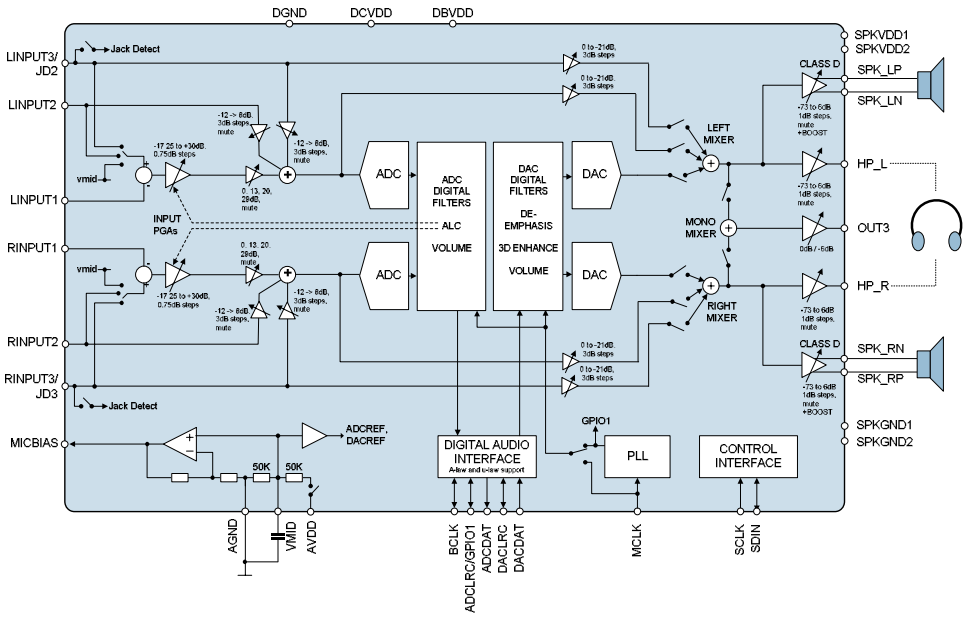

TABLE OF CONTENTS

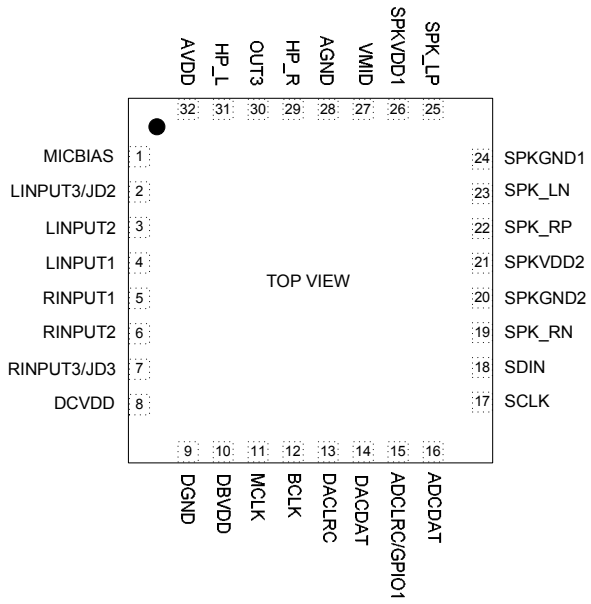
PIN CONFIGURATION



ORDERING INFORMATION

ORDER CODE	TEMPERATURE RANGE	PACKAGE	MOISTURE SENSITIVITY LEVEL	PEAK SOLDERING TEMPERATURE
WM8960GEFL/V	-40°C to +85°C	32-pin QFN (5x5x0.9mm) (Pb-free)	MSL3	260°C
WM8960GEFL/RV	-40°C to +85°C	32-pin QFN (5x5x0.9mm) (Pb-free, Tape and reel)	MSL3	260°C

Note:
Reel quantity = 3500

PIN DESCRIPTION

PIN NO	NAME	TYPE	DESCRIPTION
1	MICBIAS	Analogue Output	Microphone bias
2	LINPUT3 / JD2	Analogue Input	Left channel line input / Left channel positive differential MIC input / Jack detect input pin
3	LINPUT2	Analogue Input	Left channel line input / Left channel positive differential MIC input
4	LINPUT1	Analogue Input	Left channel single-ended MIC input / Left channel negative differential MIC input
5	RINPUT1	Analogue Input	Right channel single-ended MIC input / Right channel negative differential MIC input
6	RINPUT2	Analogue Input	Right channel line input / Right channel positive differential MIC input
7	RINPUT3 / JD3	Analogue Input	Right channel line input / Right channel positive differential MIC input / Jack detect input pin
8	DCVDD	Supply	Digital core supply
9	DGND	Supply	Digital ground (Return path for both DCVDD and DBVDD)
10	DBVDD	Supply	Digital buffer (I/O) supply
11	MCLK	Digital Input	Master clock
12	BCLK	Digital Input / Output	Audio interface bit clock
13	DACLRC	Digital Input / Output	Audio interface DAC left / right clock
14	DACDAT	Digital Input	DAC digital audio data
15	ADCLRC / GPIO1	Digital Input / Output	Audio interface ADC left / right clock / GPIO1 pin
16	ADCDAT	Digital Output	ADC digital audio data
17	SCLK	Digital Input	Control interface clock input
18	SDIN	Digital Input/Output	Control interface data input / 2-wire acknowledge output
19	SPK_RN	Analogue Output	Right speaker negative output
20	SPKGND2	Supply	Ground for speaker drivers 2
21	SPKVDD2	Supply	Supply for speaker drivers 2
22	SPK_RP	Analogue Output	Right speaker positive output
23	SPK_LN	Analogue Output	Left speaker negative output
24	SPKGND1	Supply	Ground for speaker drivers 1
25	SPK_LP	Analogue Output	Left speaker positive output
26	SPKVDD1	Supply	Supply for speaker drivers 1
27	VMID	Analogue Output	Midrail voltage decoupling capacitor
28	AGND	Supply	Analogue ground (Return path for AVDD)
29	HP_R	Analogue Output	Right output (Line or headphone)
30	OUT3	Analogue Output	Mono, left, right or buffered midrail output for capless mode
31	HP_L	Analogue Output	Left output (Line or headphone)
32	AVDD	Supply	Analogue supply
33	GND_PADDLE		Die Paddle (Note 1)

Note:

1. It is recommended that the QFN ground paddle should be connected to analogue ground on the application PCB.
2. Refer to the application note WAN_0118 on “Guidelines on How to Use QFN Packages and Create Associated PCB Footprints”

ABSOLUTE MAXIMUM RATINGS

Absolute Maximum Ratings are stress ratings only. Permanent damage to the device may be caused by continuously operating at or beyond these limits. Device functional operating limits and guaranteed performance specifications are given under Electrical Characteristics at the test conditions specified.

ESD Sensitive Device. This device is manufactured on a CMOS process. It is therefore generically susceptible to damage from excessive static voltages. Proper ESD precautions must be taken during handling and storage of this device.

Wolfson tests its package types according to IPC/JEDEC J-STD-020B for Moisture Sensitivity to determine acceptable storage conditions prior to surface mount assembly. These levels are:

MSL1 = unlimited floor life at <30°C / 85% Relative Humidity. Not normally stored in moisture barrier bag.
MSL2 = out of bag storage for 1 year at <30°C / 60% Relative Humidity. Supplied in moisture barrier bag.
MSL3 = out of bag storage for 168 hours at <30°C / 60% Relative Humidity. Supplied in moisture barrier bag.

The Moisture Sensitivity Level for each package type is specified in Ordering Information.

CONDITION	MIN	MAX
Supply voltages (excluding SPKVDD1 and SPKVDD2)	-0.3V	+4.5V
SPKVDD1, SPKVDD2	-0.3V	+7V
Voltage range digital inputs	DGND -0.3V	DBVDD +0.3V
Voltage range analogue inputs	AGND -0.3V	AVDD +0.3V
Operating temperature range, T_A	-40°C	+85°C
Storage temperature after soldering	-65°C	+150°C

Notes

1. Analogue, digital and speaker grounds must always be within 0.3V of each other.
2. All digital and analogue supplies are completely independent from each other (i.e. not internally connected).
3. DCVDD must be less than or equal to AVDD and DBVDD.
4. AVDD must be less than or equal to SPKVDD1 and SPKVDD2.
5. SPKVDD1 and SPKVDD2 must be high enough to support the peak output voltage when using DCGAIN and ACGAIN functions, to avoid output waveform clipping. Peak output voltage is AVDD*(DCGAIN+ACGAIN)/2.

RECOMMENDED OPERATING CONDITIONS

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
Digital supply range (Core)	DCVDD	1.71		3.6	V
Digital supply range (Buffer)	DBVDD	1.71		3.6	V
Analogue supplies range	AVDD	2.7		3.6	V
Speaker supply range	SPKVDD1, SPKVDD2	2.7		5.5	V
Ground	DGND, AGND, SPKGND1, SPKGND2		0		V

ELECTRICAL CHARACTERISTICS

Test Conditions

DCVDD = 1.8V, DBVDD = 3.3V, AVDD = SPKVDD1 = SPKVDD2 = 3.3V, T_A = +25°C, 1kHz signal, fs = 48kHz, PGA gain = 0dB, 24-bit audio data unless otherwise stated.

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Analogue Inputs (LINPUT1, RINPUT1, LINPUT2, LINPUT3, RINPUT2, RINPUT3)						
Full-scale Input Signal Level – note this changes in proportion to AVDD	V_{INFS}	L/RINPUT1 Single-ended or differential MIC		1.0 0		Vrms dBV
		L/RINPUT2/3 Differential MIC		0.5 -6		Vrms dBV
		L/RINPUT2/3 Boost or bypass path		0.5 -6		Vrms dBV
		L/RINPUT3 Boost + bypass path		0.5 -6		Vrms dBV
Mic PGA equivalent input noise		0 to 20kHz, +30dB gain		150		uV
Input resistance (Note that input boost and bypass path resistances will be seen in parallel with PGA input resistance when these paths are enabled)	R_{INPUT1}	+30dB PGA gain Differential or single-ended MIC configuration		3		kΩ
	R_{INPUT1}	0dB PGA gain Differential or single-ended MIC configuration		49		kΩ
	R_{INPUT1}	-17.25dB PGA gain Differential or single-ended MIC configuration		87		kΩ
	R_{INPUT2}, R_{INPUT3}	(Constant for all gains) Differential MIC configuration		85		kΩ
	R_{INPUT2}, R_{INPUT3}	Max boost gain L/RINPUT2/3 to boost		7.5		kΩ
	R_{INPUT2}, R_{INPUT3}	0dB boost gain L/RINPUT2/3 to boost		13		kΩ
	R_{INPUT2}, R_{INPUT3}	Min boost gain L/RINPUT2/3 to boost		37		kΩ
	R_{INPUT3}	Max bypass gain L/RINPUT2/3 to bypass		20		kΩ
	R_{INPUT3}	Min bypass gain L/RINPUT2/3 to bypass		224		kΩ
Input capacitance				10		pF
MIC Programmable Gain Amplifier (PGA)						
Programmable Gain Min				-17.25		dB
Programmable Gain Max				30		dB
Programmable Gain Step Size		Guaranteed monotonic		0.75		dB
Mute Attenuation		LMIC2B = 0 and RMIC2B = 0		90		dB
Selectable Input Gain Boost						
Gain Boost Steps		Input from PGA		0, 13, 20, 29, MUTE		dB
		Input from L/RINPUT2 or L/RINPUT3		-12, -9, -6, -3 0, 3, 6, MUTE		dB

Test Conditions

DCVDD = 1.8V, DBVDD = 3.3V, AVDD = SPKVDD1 = SPKVDD2 = 3.3V, T_A = +25°C, 1kHz signal, fs = 48kHz, PGA gain = 0dB, 24-bit audio data unless otherwise stated.

INTERNAL POWER ON RESET CIRCUIT

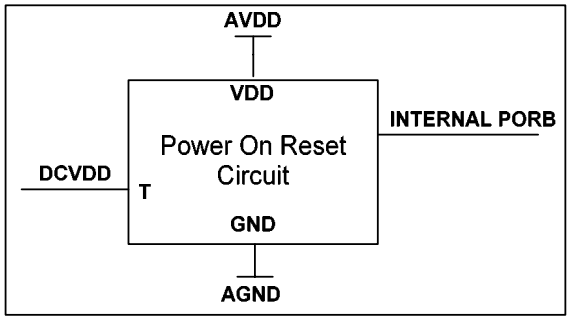

Figure 5 Internal Power on Reset Circuit Schematic

The WM8960 includes an internal Power-On-Reset Circuit, as shown in Figure 5, which is used to reset the digital logic into a default state after power up. The POR circuit is powered from AVDD and monitors DCVDD. It asserts PORB low if AVDD or DCVDD is below a minimum threshold.

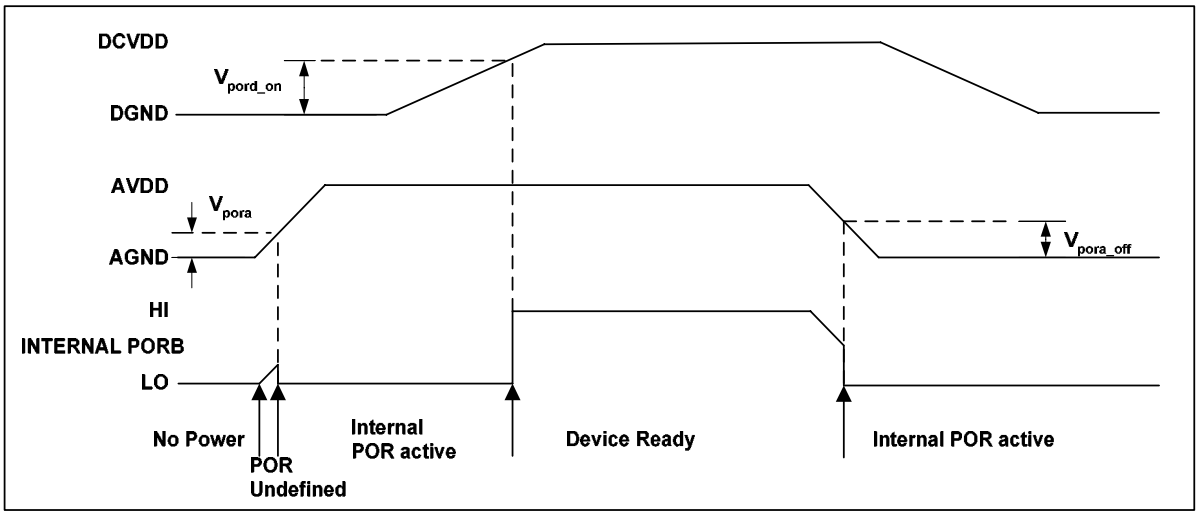

Figure 6 Typical Power up sequence where AVDD is Powered before DCVDD

Figure 6 shows a typical power-up sequence where AVDD comes up first. When AVDD goes above the minimum threshold, V_{pora}, there is enough voltage for the circuit to guarantee PORB is asserted low and the chip is held in reset. In this condition, all writes to the control interface are ignored. Now AVDD is at full supply level. Next DCVDD rises to V_{pord_on} and PORB is released high and all registers are in their default state and writes to the control interface may take place.

On power down, where AVDD falls first, PORB is asserted low whenever AVDD drops below the minimum threshold V_{pora_off}.

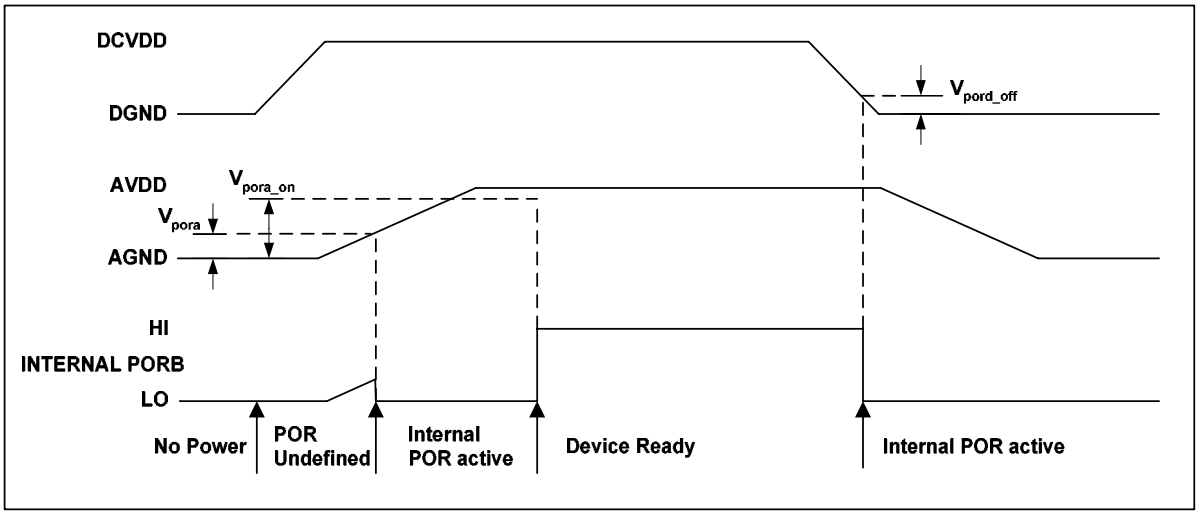

Figure 7 Typical Power up Sequence where DCVDD is Powered before AVDD

Figure 7 shows a typical power-up sequence where DCVDD comes up first. First it is assumed that DCVDD is already up to specified operating voltage. When AVDD goes above the minimum threshold, V_{pora}, there is enough voltage for the circuit to guarantee PORB is asserted low and the chip is held in reset. In this condition, all writes to the control interface are ignored. When AVDD rises to V_{pora_on}, PORB is released high and all registers are in their default state and writes to the control interface may take place.

On power down, where DCVDD falls first, PORB is asserted low whenever DCVDD drops below the minimum threshold V_{pord_off}.

SYMBOL	MIN	TYP	MAX	UNIT
V_{pora}	0.4	0.6	0.8	V
V_{pora_on}	0.9	1.2	1.6	V
V_{pora_off}	0.4	0.6	0.8	V
V_{pord_on}	0.5	0.7	0.9	V
V_{pord_off}	0.4	0.6	0.8	V

Table 1 Typical POR Operation (typical values, not tested)

Notes:

1. If AVDD and DCVDD suffer a brown-out (i.e. drop below the minimum recommended operating level but do not go below V_{pora_off} or V_{pord_off}) then the chip will not reset and will resume normal operation when the voltage is back to the recommended level again.
2. The chip will enter reset at power down when AVDD or DCVDD falls below V_{pora_off} or V_{pord_off}. This may be important if the supply is turned on and off frequently by a power management system.
3. The minimum t_{por} period is maintained even if DCVDD and AVDD have zero rise time. This specification is guaranteed by design rather than test.

DEVICE DESCRIPTION

INTRODUCTION

The WM8960 is a low power audio codec offering a combination of high quality audio, advanced features, low power and small size. These characteristics make it ideal for portable digital audio applications with stereo speaker and headphone outputs such as games consoles, portable media players and multimedia phones.

Stereo class D speaker drivers can provide >1W per channel into 8Ω loads. BTL configuration provides high power output and excellent PSRR. Low leakage and pop/click suppression mechanisms allow direct battery connection, reducing component count and power consumption in portable battery-powered applications. Highly flexible speaker boost settings provide fully internal level-shifting of analogue output signals, allowing speaker output power to be maximised while minimising other analogue supply currents, and requiring no additional components.

A flexible input configuration includes support for two stereo microphone interfaces (single-ended or pseudo-differential) and additional stereo line inputs. Up to three stereo analogue input sources are available, removing the need for external analogue switches in many applications. Boost amplifiers are available for additional gain on the microphone inputs and a programmable gain amplifier with a mixed signal automatic level control (ALC) keeps the recording volume constant.

The stereo ADC and DAC are of hi-fi quality using a 24-bit, low-order oversampling architecture to deliver optimum performance. A flexible clocking arrangement supports mixed ADC and DAC sample rates.

The DAC output signal can be mixed with analogue input signals from the line inputs or bypass paths. This mix is available on speaker and headphone/line outputs.

The WM8960 has a configurable digital audio interface where ADC data can be read and digital audio playback data fed to the DAC. It supports a number of audio data formats including I^2S, DSP Mode (a burst mode in which frame sync plus two data packed words are transmitted), MSB-First, left justified and MSB-First, right justified, and can operate in master or slave modes. In PCM mode A-law and μ-law companding is supported.

The SYSCLK (system clock) provides clocking for the ADCs, DACs, DSP core, class D outputs and the digital audio interface. SYSCLK can be derived directly from the MCLK pin or via an integrated PLL, providing flexibility to support a wide range of clocking schemes. All MCLK frequencies typically used in portable systems are supported for sample rates between 8kHz and 48kHz. A flexible switching clock for the class D speaker drivers (synchronous with the audio DSP clocks for best performance) is also derived from SYSCLK.

To allow full software control over all its features, the WM8960 uses a 2 wire control interface. It is fully compatible and an ideal partner for a wide range of industry standard microprocessors, controllers and DSPs. Unused circuitry can be disabled via software to save power, while low leakage currents extend standby and off time in portable battery-powered applications.

INPUT SIGNAL PATH

The WM8960 has three flexible stereo analogue input channels which can be configured as line inputs, differential microphone inputs or single-ended microphone inputs. Line inputs and microphone PGA outputs can be routed to the hi-fi ADCs or directly to the output mixers via a bypass path.

MICROPHONE INPUTS

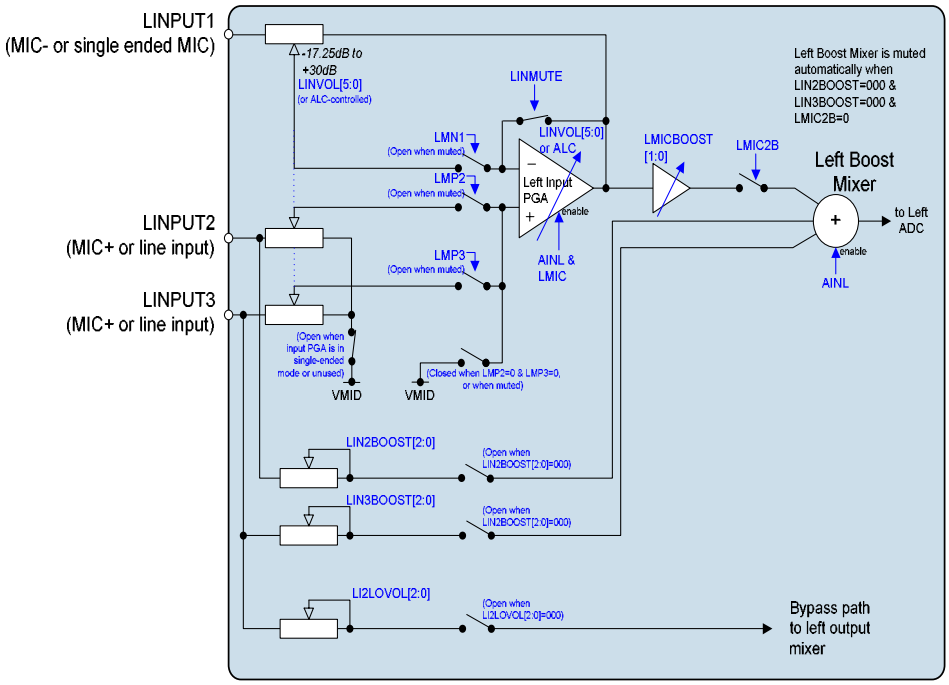
Differential microphones can be connected between LINPUT1 and LINPUT2 or LINPUT3, and between RINPUT1 and RINPUT2 or RINPUT3. Alternatively single-ended microphones can be connected to LINPUT1 or RINPUT1.

In single-ended microphone input configuration the microphone signal should be input to LINPUT1 or RINPUT1 and the internal non-inverting input of the input PGA should be switched to VMID.

In differential mode the larger signal should be input to LINPUT2 or LINPUT3 on the left channel, or RINPUT2 or RINPUT3 on the right channel. The smaller (e.g. noisy ground connection) should be input to LINPUT1 or RINPUT1.

The gain of the microphone PGAs can be controlled directly via software, or using the ALC / Limiter.

The inputs LINPUT2, RINPUT2, LINPUT3 and RINPUT3 should not be connected to the boost mixer or bypass path while operating as the non-inverting input in differential microphone configuration.



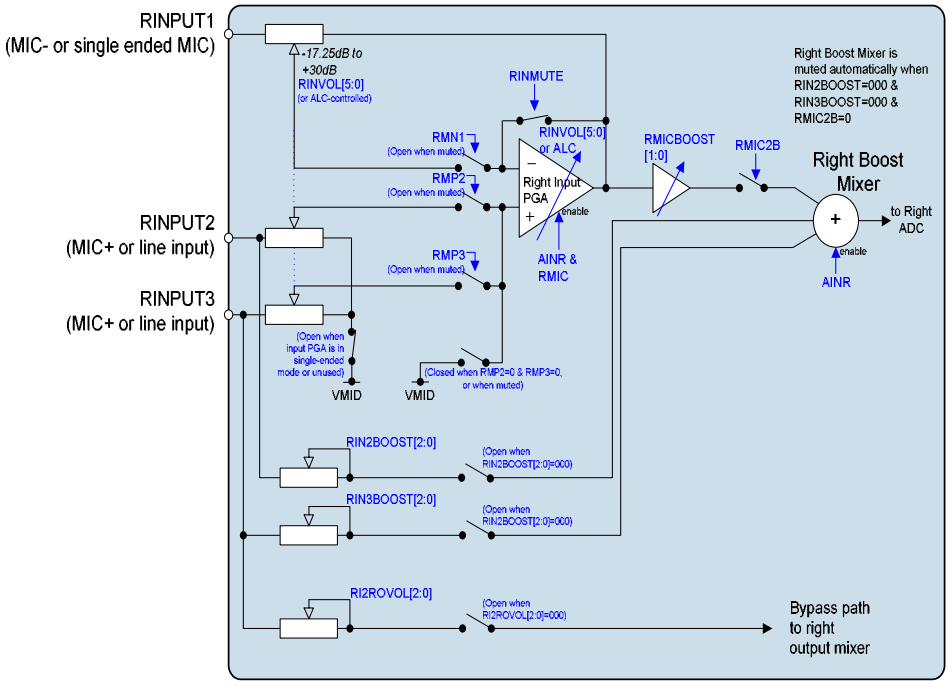


Figure 8 Microphone Input PGA Circuit

The input PGAs and boost mixers are enabled by the AINL and AINR register bits. The microphone PGAs can be also be disabled independently of the boost mixer to save power, using LMIC and RMIC register bits.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

R47 (2Fh) Power Management (3)	5	LMIC	0	Left channel input PGA enable 0 = PGA disabled 1 = PGA enabled (if AINL = 1)
	4	RMIC	0	Right channel input PGA enable 0 = PGA disabled 1 = PGA enabled (if AINR = 1)

Table 2 Input PGA and Boost Enable Register Settings

The input PGAs can be configured as differential inputs, using LINPUT1/LINPUT2 or LINPUT1/LINPUT3, and RINPUT1/RINPUT2 or RINPUT1/RINPUT3. The input impedance to these non-inverting inputs is constant in this configuration. Differential configuration is controlled by LMP2, LMP3, RMP2 and RMP3 as shown in Table 3.

When single-ended configuration is selected, the non-inverting input of the PGA is connected to VMID.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 3 Input PGA Control

INPUT PGA VOLUME CONTROLS

The input PGAs have a gain range from -17.25dB to +30dB in 0.75dB steps. The gains from the inverting inputs (LINPUT1 and RINPUT1) to the PGA outputs and from the non-inverting inputs (LINPUT2/RINPUT2 and LINPUT3/RINPUT3) to the PGA output are always common in differential configuration and controlled by the register bits LINVOL[5:0] and RINVOL[5:0].

When the Automatic Level Control (ALC) is enabled the input PGA gains are controlled automatically and the LINVOL and RINVOL bits should not be used.

The left and right input PGAs can be independently muted using the LINMUTE and RINMUTE register bits.

To allow simultaneous volume updates of left and right channels, PGA gains are not altered until a 1 is written to the IPVU bit.

To prevent "zipper noise", a zero-cross function is provided, so that when enabled, volume updates will not take place until a zero-crossing is detected. In the event of a long period without zero-crossings, a timeout function is available. When this function is enabled (using the TOEN register bit), the volume will update automatically after a timeout. The timeout period is set by TOCLKSEL. Note that SYSCLK must be running to use this function.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

	1	TOCLKSEL	0	Slow Clock Selection (Used for volume update timeouts and for jack detect debounce) 0 = SYSCLK / 2^{21} (Slower Response) 1 = SYSCLK / 2^{19} (Faster Response)

Table 4 Input PGA Volume Control

See "Volume Updates" for more information on volume update bits, zero cross and timeout operation.

LINE INPUTS

Two pairs of stereo line inputs (LINPUT2 / RINPUT2 and LINPUT3 / RINPUT3) are available as analogue inputs into the ADC path. LINPUT3 and RINPUT3 can also be input directly to the output mixers via the bypass paths.

See "Output Signal Path" for more information on the bypass paths.

INPUT BOOST

The input path to the ADCs is via a boost stage, which can mix signals from the microphone PGAs and the line inputs.

The boost stage can provide up to +29dB additional gain from the microphone PGA output to the ADC input, providing a total maximum available analogue gain of +59dB from microphone to ADC. The microphone PGA path to the boost mixer is muted using LINMUTE and RINMUTE as shown in Table 4. Microphone PGA to boost gain settings are shown in Table 5.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R32 (20h) ADCL Signal path	5:4	LMICBOOST [1:0]	00	Left Channel Input PGA Boost Gain 00 = +0dB 01 = +13dB 10 = +20dB 11 = +29dB

Table 6 Line Input Boost Control

When all three input paths to the boost mixer are disabled, the boost mixer will automatically be muted.

MICROPHONE BIASING CIRCUIT

The MICBIAS output provides a low noise reference voltage suitable for biasing electret type microphones and the associated external resistor biasing network. Refer to the Applications Information section for recommended external components. The MICBIAS voltage can be altered via the MBSEL register bit. When MBSEL=0, MICBIAS=0.9*AVDD and when MBSEL=1, MICBIAS=0.65*AVDD. The output can be enabled or disabled using the MICB control bit.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R25 (19h) Power management (1)	1	MICB	0	Microphone Bias Enable 0 = OFF (high impedance output) 1 = ON
R48 (30h) Additional Control (4)	0	MBSEL	0	Microphone Bias Voltage Control 0 = 0.9 * AVDD 1 = 0.65 * AVDD

Table 7 Microphone Bias Control

The internal MICBIAS circuitry is shown in Figure 9. The maximum source current capability for MICBIAS is 3mA. The external biasing resistors therefore must be large enough to limit the MICBIAS current to 3mA.

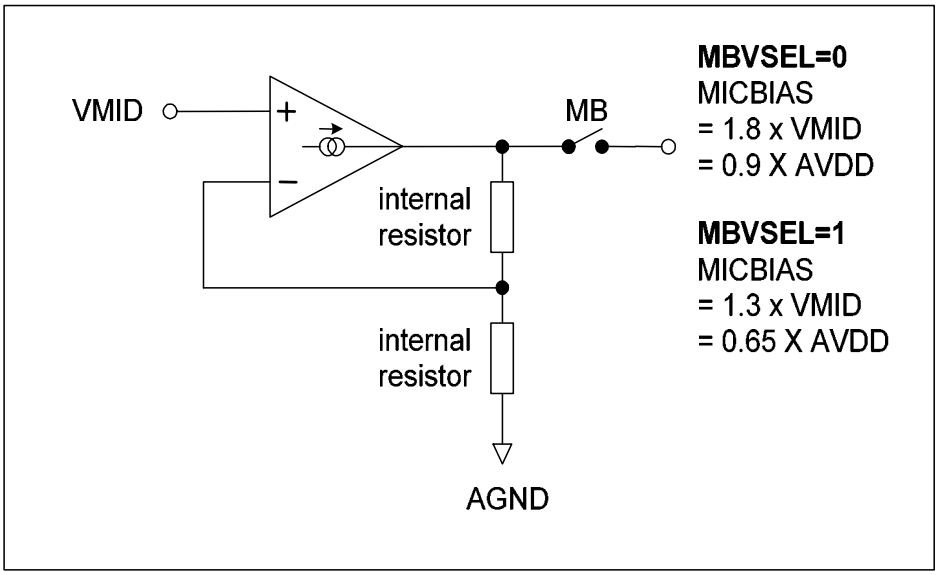

Figure 9 Microphone Bias Schematic

EXAMPLE INPUT CONFIGURATIONS

Some example input configurations are shown below.

	Single-ended MIC configuration on left channel. LINPUT2 and LINPUT3 unused
	Pseudo-differential MIC configuration on left channel using LINPUT1 as ground connection and LINPUT2 as signal input. LINPUT3 unused.
	Single-ended MIC configuration on left channel. LINPUT2 used as additional input to boost stage. LINPUT3 unused.
	Single-ended MIC configuration on left channel. LINPUT3 used as input to bypass path. LINPUT2 unused.

Figure 10 Example Microphone Input Configurations (See also "Recommended External Components")

ANALOGUE TO DIGITAL CONVERTER (ADC)

The WM8960 uses stereo 24-bit, 64x oversampled sigma-delta ADCs. The use of multi-bit feedback and high oversampling rates reduce the effects of jitter and high frequency noise. The ADC Full Scale input level is proportional to AVDD. With a 3.3V supply voltage, the full scale level is $1.0V_{rms}$. Any voltage greater than full scale may overload the ADC and cause distortion.

The ADCs are enabled by the ADCL/R register bit.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R25 (19h) Power management (2)	3	ADCL	0	Enable ADC left channel: 0 = ADC disabled 1 = ADC enabled
	2	ADCR	0	Enable ADC right channel: 0 = ADC disabled 1 = ADC enabled

Table 8 ADC Enable Control

The polarity of the output signal can be changed under software control using the ADCPOL[1:0] register bits. The DATSEL bits are used to select which channel is used for the left and right ADC data.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R5 (05h) ADC and DAC Control (1)	6:5	ADCPOL[1:0]	00	ADC polarity control: 00 = Polarity not inverted 01 = ADC L inverted 10 = ADC R inverted 11 = ADC L and R inverted

Table 9 ADC Control

DIGITAL ADC VOLUME CONTROL

The output of the ADCs can be digitally amplified or attenuated over a range from –97dB to +30dB in 0.5dB steps. The volume of each channel can be controlled separately. The gain for a given eight-bit code X is given by:

$0.5 \times (X-195)$ dB for $1 \leq X \leq 255$; MUTE for $X = 0$

The ADCVU control bit controls the loading of digital volume control data. When ADCVU is set to 0, the LADCVOL or RADCVOL control data will be loaded into the respective control register, but will not actually change the digital gain setting. Both left and right gain settings are updated when ADCVU is set to 1. This makes it possible to update the gain of both channels simultaneously.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R21 (15h) Left ADC Digital Volume	7:0	LADCVOL [7:0]	11000011 (0dB)	Left ADC Digital Volume Control 0000 0000 = Digital Mute 0000 0001 = -97dB 0000 0010 = -96.5dB ... 0.5dB steps up to 1111 1111 = +30dB

	8	ADCVU	0	ADC Volume Update 0 = Store RADCVOL in intermediate latch (no gain change) 1 = Update left and right channel gains (left = intermediate latch, right = RADCVOL)

Table 10 ADC Digital Volume Control

ADC DIGITAL FILTERS

The ADC filters perform true 24-bit signal processing to convert the raw multi-bit oversampled data from the ADC to the correct sampling frequency to be output on the digital audio interface.

HIGH PASS FILTER

A digital high pass filter is applied by default to the ADC path to remove DC offsets. This filter can be disabled using the ADCHPD register bit.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R5 (05h) ADC and DAC Control (1)	0	ADCHPD	0	ADC High Pass Filter Disable 0 = Enable high pass filter on left and right channels 1 = Disable high pass filter on left and right channels

Table 11 ADC High Pass Filter

The high pass filter characteristics are shown in the Digital Filter Characteristics section.

AUTOMATIC LEVEL CONTROL (ALC)

The WM8960 has an automatic level control that aims to keep a constant recording volume irrespective of the input signal level. This is achieved by continuously adjusting the PGA gain so that the signal level at the ADC input remains constant. A digital peak detector monitors the ADC output and changes the PGA gain if necessary. Note that when the ALC function is enabled, the settings of registers 0 and 1 (LINVOL, IPVU, LIZC, LINMUTE, RINVOL, RIZC and RINMUTE) are ignored.

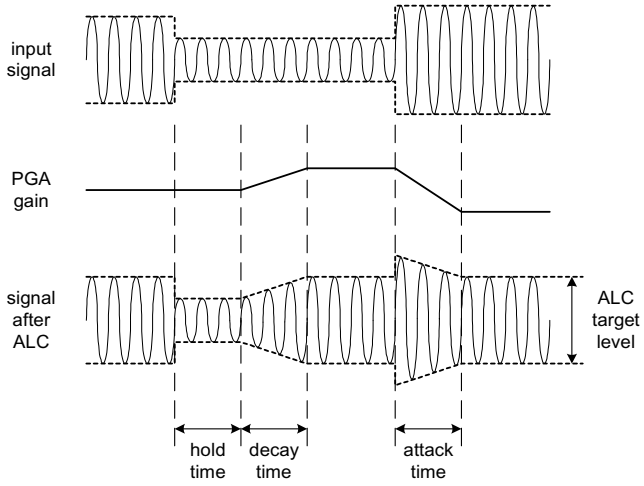

Figure 11 ALC Operation

The ALC function is enabled using the ALCSEL control bits. When enabled, the recording volume can be programmed between –1.5dB and –22.5dB (relative to ADC full scale) using the ALCL register bits. An upper limit for the PGA gain can be imposed by setting the MAXGAIN control bits.

HLD, DCY and ATK control the hold, decay and attack times, respectively:

Hold time is the time delay between the peak level detected being below target and the PGA gain beginning to ramp up. It can be programmed in power-of-two (2^n) steps, e.g. 2.67ms, 5.33ms, 10.67ms etc. up to 43.7s. Alternatively, the hold time can also be set to zero. The hold time only applies to gain ramp-up, there is no delay before ramping the gain down when the signal level is above target.

Decay (Gain Ramp-Up) Time is the time that it takes for the PGA gain to ramp up across 90% of its range (e.g. from –15B up to 27.75dB). The time it takes for the recording level to return to its target value therefore depends on both the decay time and on the gain adjustment required. If the gain adjustment is small, it will be shorter than the decay time. The decay time can be programmed in power-of-two (2^n) steps, from 24ms, 48ms, 96ms, etc. to 24.58s.

Attack (Gain Ramp-Down) Time is the time that it takes for the PGA gain to ramp down across 90% of its range (e.g. from 27.75dB down to -15B gain). The time it takes for the recording level to return to its target value therefore depends on both the attack time and on the gain adjustment required. If the gain adjustment is small, it will be shorter than the attack time. The attack time can be programmed in power-of-two (2^n) steps, from 6ms, 12ms, 24ms, etc. to 6.14s.

When operating in stereo, the peak detector takes the maximum of left and right channel peak values, and any new gain setting is applied to both left and right PGAs, so that the stereo image is preserved. However, the ALC function can also be enabled on one channel only. In this case, only one PGA is controlled by the ALC mechanism, while the other channel runs independently with its PGA gain set through the control register.

When one ADC channel is unused, the peak detector disregards that channel.

Table 12 ALC Control

ALC SAMPLE RATE CONTROL

The register bits ADC_ALC_SR must be set correctly to ensure that the ALC attack, decay and hold times are correct for the chosen sample rate as shown in Table 12.

PEAK LIMITER

To prevent clipping when a large signal occurs just after a period of quiet, the ALC circuit includes a limiter function. If the ADC input signal exceeds 87.5% of full scale (–1.16dB), the PGA gain is ramped down at the maximum attack rate (as when ATK = 0000), until the signal level falls below 87.5% of full scale. This function is automatically enabled whenever the ALC is enabled.

Note:

If ATK = 0000, then the limiter makes no difference to the operation of the ALC. It is designed to prevent clipping when long attack times are used.

NOISE GATE

When the signal is very quiet and consists mainly of noise, the ALC function may cause “noise pumping”, i.e. loud hissing noise during silence periods. The WM8960 has a noise gate function that prevents noise pumping by comparing the signal level at the input pins against a noise gate threshold, NGTH. The noise gate cuts in when:

- Signal level at ADC [dB] < NGTH [dB] + PGA gain [dB] + Mic Boost gain [dB]

This is equivalent to:

- Signal level at input pin [dB] < NGTH [dB]

The PGA gain will then be held constant (preventing it from ramping up as it normally would when the signal is quiet).

The table below summarises the noise gate control register. The NGTH control bits set the noise gate threshold with respect to the ADC full-scale range. The threshold is adjusted in 1.5dB steps. Levels at the extremes of the range may cause inappropriate operation, so care should be taken with set–up of the function. Note that the noise gate only works in conjunction with the ALC function, and always operates on the same channel(s) as the ALC (left, right, both, or none).

Table 13 Noise Gate Control

OUTPUT SIGNAL PATH

The hi-fi DACs and DAC digital filters are enabled by register bits DACL and DACR. The mixers and output drivers can be separately enabled by individual control bits (see Analogue Outputs). Thus it is possible to utilise the analogue mixing and amplification provided by the WM8960, irrespective of whether the DACs are enabled or not.

The WM8960 DACs receive digital input data on the DACDAT pin. The digital filter block processes the data to provide the following functions:

- Digital volume control with soft mute and soft un-mute
- Mono mix
- 3D stereo enhancement
- De-emphasis
- Sigma-delta modulation

High performance sigma-delta 24-bit audio DAC converts the digital data into an analogue signal.

The analogue outputs from the DACs can then be mixed with the analogue line inputs and the ADC analogue inputs. This mix is fed to the output drivers for headphone or speaker output. OUT3 can provide a mono mix of left and right mixers or a pseudo-ground for capless headphone drive.

DIGITAL PLAYBACK (DAC) PATH

Digital data is passed to the WM8960 via the flexible audio interface to the hi-fi DACs. The DACs are enabled by the DACL and DACR register bits.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R26 (1Ah) Power Management (2)	8	DACL	0	Left Channel DAC Enable 0 = DAC disabled 1 = DAC enabled
	7	DACR	0	Right Channel DAC Enable 0 = DAC disabled 1 = DAC enabled

Table 14 DAC Enable Control

DIGITAL DAC VOLUME CONTROL

The signal volume from each DAC can be controlled digitally, in the same way as the ADC volume (see Digital ADC Volume Control). The gain and attenuation range is –127dB to 0dB in 0.5dB steps. The level of attenuation for an eight-bit code X is given by:

$0.5 \times (X-255)$ dB for $1 \leq X \leq 255$; MUTE for $X = 0$

The DACVU control bit controls the loading of digital volume control data. When DACVU is set to 0, the LDACVOL or RDACVOL control data is loaded into an intermediate register, but the actual gain does not change. Both left and right gain settings are updated simultaneously when DACVU is set to 1.

See "Volume Updates" for more information on volume update bits.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 15 Digital Volume Control

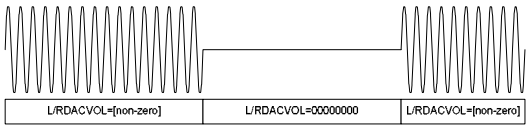
DAC SOFT MUTE AND SOFT UN-MUTE

The WM8960 also has a soft mute function, which, when enabled, gradually attenuates the volume of the digital signal to zero. When soft mute is disabled, the gain will either gradually ramp back up to the digital gain setting, or return instantly to the digital gain setting, depending on the DACSMM register bit.

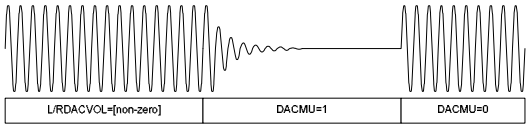
The DAC is soft-muted by default. To play back an audio signal, this function must first be disabled by setting the DACMU bit to zero.

DACSMM would typically be enabled when using soft mute during playback of audio data so that when soft mute is then disabled, the sudden volume increase will not create pop noise by jumping immediately to the previous volume level (e.g. resuming playback after pausing during a track).

DACSMM would typically be disabled when un-muting at the start of a digital music file, so that the first part of the track is not attenuated (e.g. when starting playback of a new track, or resuming playback after pausing between tracks).

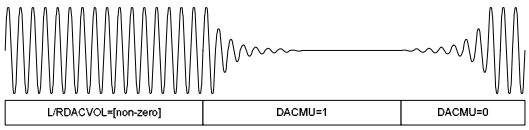


DAC muting and un-muting using volume control bits LDACVOL and RDACVOL.



DAC muting and un-muting using soft mute bit DACMU.

Soft un-mute not enabled (DACSMM = 0).



DAC muting and un-muting using soft mute bit DACMU.

Soft un-mute enabled (DACSMM = 1).

Figure 12 DAC Mute Control

The volume ramp rate during soft mute and un-mute is controlled by the DACMR bit. Ramp rates of fs/32 and fs/2 are selectable as shown in Table 16 (fs = DAC sample rate).

Table 17 DAC De-Emphasis Control

DAC OUTPUT PHASE AND MONO MIXING

The digital audio data is converted to oversampled bit streams in the on-chip, true 24-bit digital interpolation filters. The bitstream data enters two multi-bit, sigma-delta DACs, which convert them to high quality analogue audio signals. The multi-bit DAC architecture reduces high frequency noise and sensitivity to clock jitter. It also uses a Dynamic Element Matching technique for high linearity and low distortion.

In normal operation, the left and right channel digital audio data is converted to analogue in two separate DACs. There is a mono-mix mode where the two audio channels are mixed together digitally and then converted to analogue using only one DAC, while the other DAC is switched off. The mono-mix signal can be selected to appear on both analogue output channels. The mono mix is automatically attenuated by 6dB to prevent clipping.

The DAC output defaults to non-inverted. Setting DACPOL[0] bit will invert the left DAC output phase and setting DACPOL[1] bit will invert the right DAC output phase.

3D STEREO ENHANCEMENT

The WM8960 has a digital 3D enhancement option to artificially increase the separation between the left and right channels. This effect can only be used for playback, not for record.

The 3D enhancement function is activated by the 3DEN bit, and the 3DDEPTH setting controls the degree of stereo expansion. Additionally, one of four filter characteristics can be selected for the 3D processing, using the 3DUC and 3DLC control bits.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

OUTPUT MIXERS

Left and right analogue mixers allow the DAC output and analogue bypass paths to be mixed. Programmable attenuation and mute is available on the analogue bypass paths from LINPUT3, RINPUT3 and from the input boost mixers as shown in Figure 13. A mono mix of left and right output mixers is also available on OUT3.

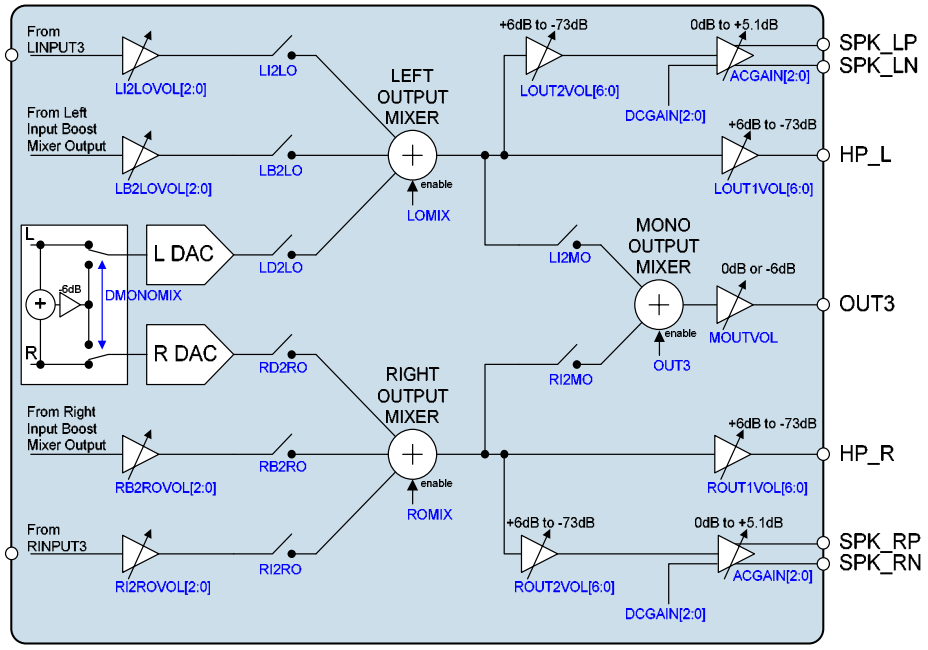

Figure 13 Output Mixer Path

Left and right mixers are enabled by the LOMIX and ROMIX register bits. The mono mixer is enabled by OUT3 register bit, which also enables the OUT3 driver.

Table 23 Output Mixer Enable Control

When left and right inputs to the mono mixer are both disabled, the mono mixer will output VMID.

ANALOGUE OUTPUTS

HP_L AND HP_R OUTPUTS

The HP_L and HP_R pins can drive a 16Ω or 32Ω headphone or a line output (see Headphone Output and Line Output sections, respectively). The signal volume on HP_L and HP_R can be independently adjusted under software control by writing to LOUT1VOL and ROUT1VOL, respectively. Note that gains over 0dB may cause clipping if the signal is large. Any gain setting below 0101111 (minimum) mutes the output driver. The corresponding output pin remains at the same DC level (the reference voltage on the VREF pin), so that no click noise is produced when muting or un-muting.

A zero cross detect on the analogue output may also be enabled when changing the gain setting to minimize audible clicks and zipper noise as the gain updates. If zero cross is enabled a timeout is also available to update the gain if a zero cross does not occur. This function may be enabled by setting TOEN in register R23 (17h). The timeout period is set by TOCLKSEL. Note: SYSCLK must be enabled to use this function.

CLASS D SPEAKER OUTPUTS

The SPK_LP/SPK_LN and SPK_RP/SPK_RN output pins are class D speaker drivers. Each pair is independently controlled and can drive an 8Ω BTL speaker (see Speaker Output section). Output mixer volume is relative to AVDD, while an additional boost stage is available to accommodate higher SPKVDD1/SPKVDD2 supply voltages. This allows AVDD to be run at a lower voltage to save power, while maximum output power can be delivered to the load, utilising the full range of SPKVDD1/SPKVDD2. Note that the BTL speaker connection provides an additional +6dB gain at the output.

Table 25 SPK_L/SPK_R Volume and Speaker Boost Control

To prevent pop noise, DCGAIN and ACGAIN should not be modified while the speaker outputs are enabled.

To avoid clipping at speaker ground, ACGAIN should not be greater than DCGAIN.

To avoid clipping at speaker supply, SPKVDD1 and SPKVDD2 must be high enough to support the peak output voltage when using DCGAIN and ACGAIN functions. The peak output voltage is AVDD*(DCGAIN+ACGAIN)/2.

DCGAIN should normally be set to the same value as ACGAIN.

See "Volume Updates" for more information on volume update bits, zero cross and timeout operation.

See "Class D Speaker Outputs" for more information on class D speaker operation.

OUT3 OUTPUT

The OUT3 pin can drive a 16Ω or 32Ω headphone or a line output or be used as a pseudo-ground for capless headphone drive (see Headphone Output section). It can also drive out a mono mix of left and right output mixers (See Output Signal Path).

ENABLING THE OUTPUTS

Each analogue output of the WM8960 can be independently enabled or disabled. The analogue mixer associated with each output is powered on or off along with the output pin. All outputs are disabled by default. To save power, unused outputs should remain disabled.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R26 (1Ah) Power Management (2)	6	LOUT1	0	LOUT1 Output Enable

Note: All “Enable” bits are 1 = ON, 0 = OFF				

Table 26 Analogue Output Control

The speaker output enable bits SPK_OP_EN[1:0] should not be enabled until there is a valid switching clock to drive the class D outputs. This means that SYSCLK must be active, and DCLKDIV set to an appropriate value to produce a class D clock of between 700kHz and 800kHz for best performance (See "Class D Speaker Outputs" and "Clocking and Sample Rates" sections for more information).

Whenever an analogue output is disabled, it remains connected to VREF through a resistor. This helps to prevent pop noise when the output is re-enabled. The resistance between VREF and each output can be controlled using the VROI bit in register 27. If a high impedance is desired for disabled outputs, VROI can then be set to 1, increasing the resistance to about 20kΩ.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R27 (1Bh) Additional (1)	6	VROI	0	VREF to Analogue Output Resistance (Disabled Outputs) 0 = 500Ω VMID to output 1 = 20kΩ VMID to output

Table 27 Disabled Outputs to VREF Resistance

HEADPHONE OUTPUT

Analogue outputs HP_L/HP_R, and OUT3, can drive a 16Ω or 32Ω headphone load, either through DC blocking capacitors, or DC coupled without any capacitor.

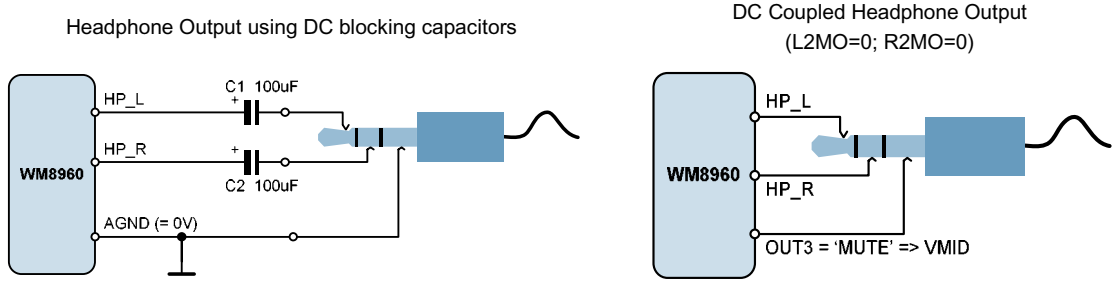

Figure 15 Recommended Headphone Output Configurations

When DC blocking capacitors are used, then their capacitance and the load resistance together determine the lower cut-off frequency, f_c. Increasing the capacitance lowers f_c, improving the bass response. Smaller capacitance values will diminish the bass response. Assuming a 32Ω load and C1, C2 = 100µF:

$f_c = 1 / 2\pi R_L C_1 = 1 / (2\pi \times 32\Omega \times 100\mu F) = 50$ Hz

In the DC coupled configuration, the headphone "ground" is connected to the OUT3 pin, which must be enabled by setting OUT3 = 1 and muted by setting L2MO=0 and R2MO=0. As the OUT3 pin produces a DC voltage of AVDD/2 (=VREF), there is no DC offset between HP_L/HP_R and OUT3, and therefore no DC blocking capacitors are required. This saves space and material cost in portable applications.

It is recommended to connect the DC coupled headphone outputs only to headphones, and not to the line input of another device. Although the built-in short circuit protection will prevent any damage to the headphone outputs, such a connection may be noisy, and may not function properly if the other device is grounded.

CLASS D SPEAKER OUTPUTS

The class D speaker outputs SPK_LN/SPK_LP and SPK_RN/SPK_RP can drive 1W into 8Ω BTL speakers. Class D outputs reduce power consumption and maximise efficiency by reducing power dissipated in the output drivers, delivering most of the power directly to the load. This is achieved by pulse width modulation (PWM) of a high frequency square wave, allowing the audio signal level to be set by controlling the pulse width. The frequency of the output waveform is controlled by DCLKDIV, and is derived from SYSCLK.

When the speakers are close to the device (typically less than about 100mm), the internal filtering effects of the speaker can be used. Where signals are routed over longer distances, it is recommended to use additional passive filtering, positioned close to the WM8960, to reduce EMI. See "Applications Information" for more information on EMI reduction.

The class D outputs require a PWM switching clock, which is derived from SYSCLK. This clock should not be altered or disabled while the class D outputs are enabled.

See "Clocking and Sample Rates" for more information.

VOLUME UPDATES

Volume settings will not be applied to input or output PGAs until a '1' is written to one of the update bits (IPVU, OUT1VU, SPKVU bits). This is to allow left and right channels to be updated at the same time, as shown in Figure 16.

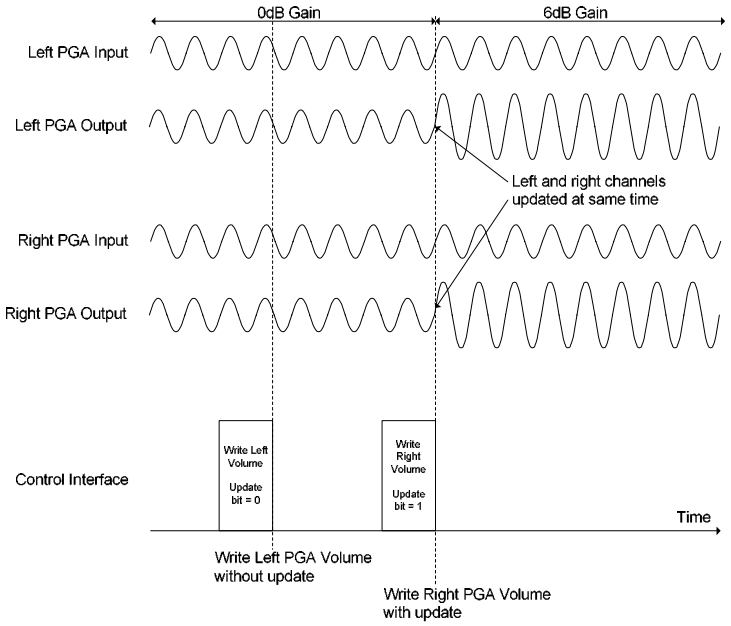

Figure 16 Simultaneous Left and Right Volume Updates

If the volume is adjusted while the signal is a non-zero value, an audible click can occur as shown in Figure 17.

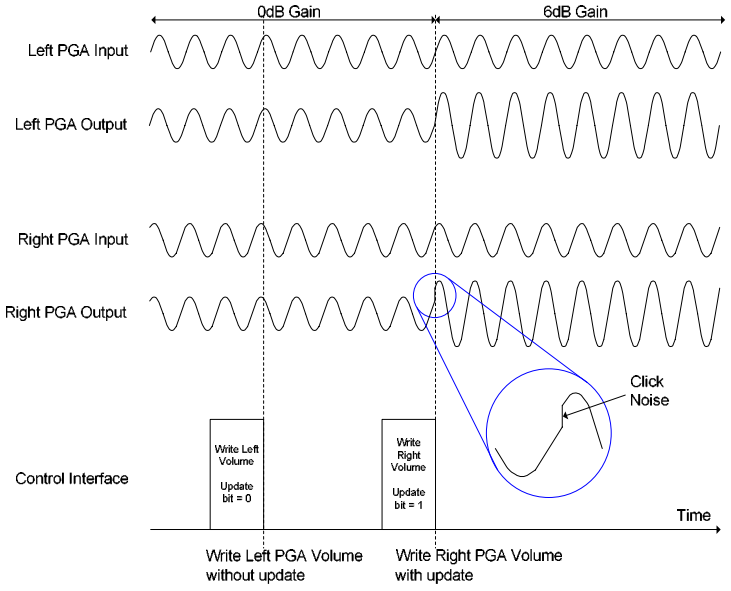

Figure 17 Click Noise During Volume Update

In order to prevent this click noise, a zero cross function is provided. When enabled, this will cause the PGA volume to update only when a zero crossing occurs, minimising click noise as shown in Figure 18.

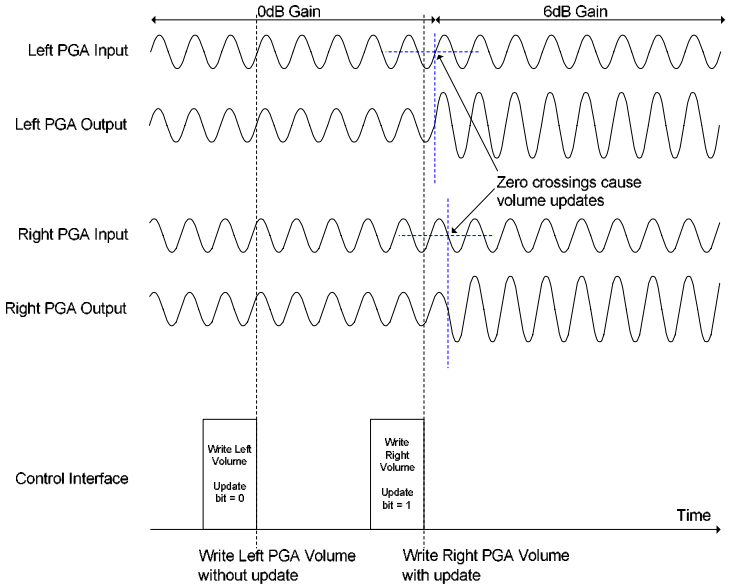

Figure 18 Volume Update Using Zero Cross Detection

If there is a long period where no zero-crossing occurs, a timeout circuit in the WM8960 will automatically update the volume. The volume updates will occur between one and two timeout periods, depending on when the volume update bit is set as shown in Figure 19. The TOEN register bit must be set to enable this timeout function. The timeout period is set by TOCLKSEL.

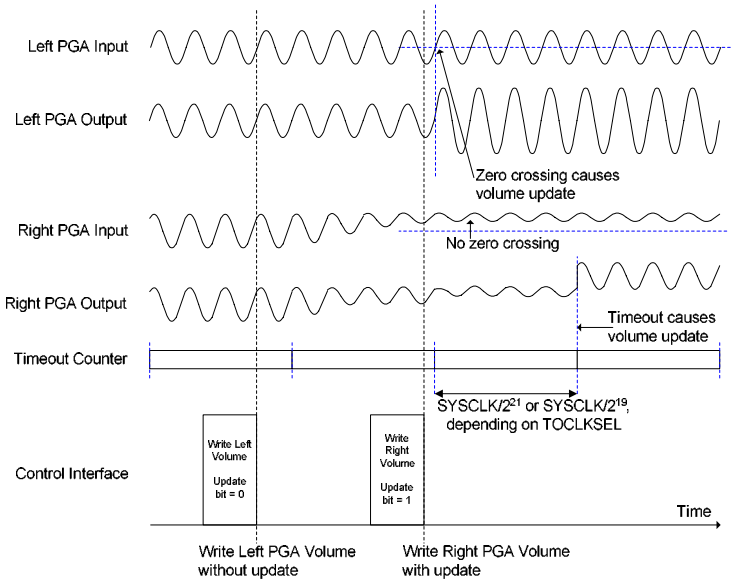

Figure 19 Volume Update after Timeout

HEADPHONE JACK DETECT

The ADCLRC/GPIO1, LINPUT3/JD2 and RINPUT3/JD3 pins can be selected as headphone jack detect inputs to automatically disable the speaker output and enable the headphone output e.g. when a headphone is plugged into a jack socket. In this mode, enabled by setting HPSWEN, the headphone detect input pin switches between headphone and speaker outputs (e.g. when the pin is connected to a mechanical switch in the headphone socket to detect plug-in). The HPSEL[1:0] bits select the input pin used for this function. The HPSWPOL bit reverses the pin's polarity. Note that the LOUT1, ROUT1, SPKL and SPKR bits in register 26 must also be set for headphone and speaker output (see Table 29 and Table 30).

TOEN must also be set to enable the clock which is used for de-bouncing the jack detect input. TOCLKSEL selects a fast or slow de-bounce period. Note that SYSCLK must be enabled to use this function.

When using capless mode, the OUT3CAP bit should be enabled so that OUT3 is enabled/disabled at the same time as HP_L and HP_R to prevent pop noise.

The debounced headphone detect signal can also be output to the ADCLRC/GPIO1 pin (See GPIO section). This function is not available when using GPIO1 as an input or as ADCLRC.

When using the ADCLRC/GPIO1 pin as a headphone detect input, the ALRCGPIO register bit needs to be set to 1. In this mode, DACLRC is used for both ADC and DAC frame clocks. (See GPIO section for more information)

Note:

When LINPUT3 or RINPUT3 is used as the headphone detect input, the thresholds become CMOS levels (0.3 AVDD / 0.7 AVDD).

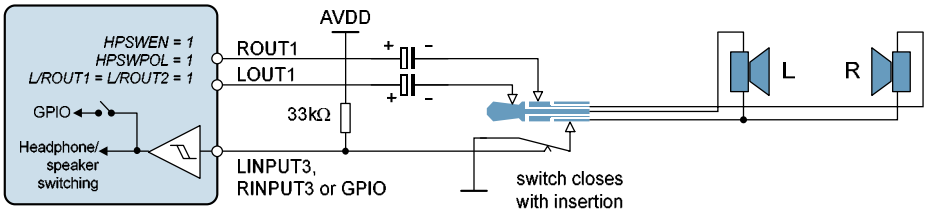

Figure 21 Example Headset Detection Circuit Using Normally-Closed Switch

THERMAL SHUTDOWN

The speaker and headphone outputs can drive very large currents. To protect the WM8960 from overheating a thermal shutdown circuit is included and is enabled by default. If the device temperature reaches approximately 150^0C and the thermal shutdown circuit is enabled (TSDEN = 1; TSENSEN = 1) the speaker and headphone amplifiers (HP_L, HP_R, SPK_LP, SPK_LN, SPK_RP, SPK_RN and OUT3) will be disabled. This feature can be disabled to save power when the device is in standby mode.

TSENSEN must be set to 1 to enable the temperature sensor when using the TSDEN thermal shutdown function. The output of the temperature sensor can also be output to the GPIO1 pin.

Table 31 Thermal Shutdown

GENERAL PURPOSE INPUT/OUTPUT

The WM8960 has three dual purpose input/output pins.

- LINPUT3/JD2: Analogue input or headphone detect input.
- RINPUT3/JD3: Analogue input or headphone detect input.
- ADCLRC/GPIO1: ADC left/right frame clock or GPIO pin.

The ADCLRC/GPIO1 pin can be configured as a left/right frame clock for the ADC, a headphone detect input, or one of a number of GPIO output functions as shown in Table 32.

The default configuration for the LINPUT3 and RINPUT2 pins is to be analogue inputs. The default configuration for the ADCLRC/GPIO1 pin is to be the ADC left/right frame clock.

Table 32 GPIO Control

Slow clock must be enabled (TOEN = 1) when using the jack detect function. This slow clock is used to debounce the jack detect input. The debounce period can be selected using TOCLKSEL.

The temperature sensor must be enabled for the "Temperature ok" GPIO output to function properly.

For further details of the Jack detect operation see the Headphone Switch section.

DIGITAL AUDIO INTERFACE

The digital audio interface is used for inputting DAC data into the WM8960 and outputting ADC data from it. It uses five pins:

- ADCDAT: ADC data output
- ADCLRC: ADC data alignment clock
- DACDAT: DAC data input
- DACLRC: DAC data alignment clock
- BCLK: Bit clock, for synchronisation

The clock signals BCLK, ADCLRC and DACLRC can be outputs when the WM8960 operates as a master, or inputs when it is a slave (see Master and Slave Mode Operation, below).

ADCLRC can also be configured as a GPIO pin. In this case, the ADC will use DACLRC as a frame clock. The ADCLRC/GPIO1 pin function should not be modified while the ADC is enabled.

Four different audio data formats are supported:

- Left justified
- Right justified
- I^2S
- DSP mode

All four of these modes are MSB first. They are described in Audio Data Formats, below. Refer to the Electrical Characteristic section for timing information.

MASTER AND SLAVE MODE OPERATION

The WM8960 can be configured as either a master or slave mode device. As a master device the WM8960 generates BCLK, ADCLRC and DACLRC and thus controls sequencing of the data transfer on ADCDAT and DACDAT. In slave mode, the WM8960 responds with data to clocks it receives over the digital audio interface. The mode can be selected by writing to the MS bit. Master and slave modes are illustrated below.

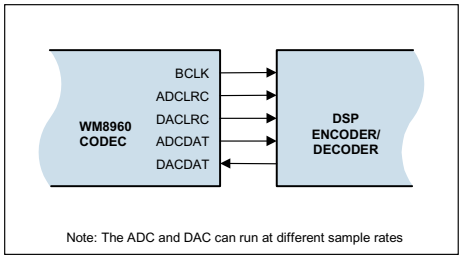

Figure 22 Master Mode

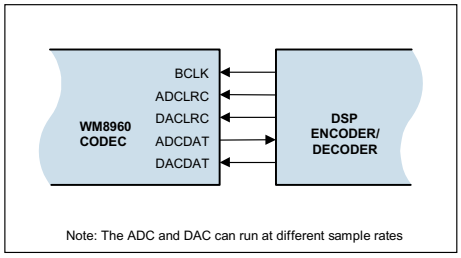

Figure 23 Slave Mode

OPERATION WITH ADCLRC AS GPIO

When ALRCGPIO=1, the DACLRC pin is used as a frame clock for ADCs and DACs as shown below. The ADCs and DACs must operate at the same sample rate in this mode. See Table 32 for details of GPIO pin configuration.

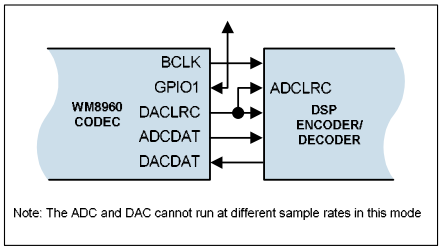

Figure 24 Master Mode with ADCLRC as GPIO

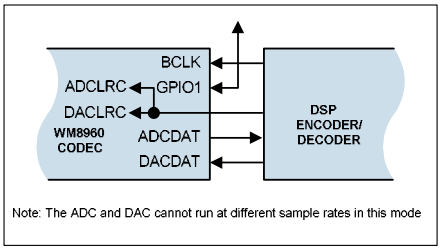

Figure 25 Slave Mode with ADCLRC as GPIO

BCLK DIVIDE

The BCLK frequency in master mode is controlled by BCLKDIV[3:0]. When the ADCs and DACs are operating at different sample rates, BCLKDIV must be set appropriately to support the data rate of whichever is the faster.

Internal clock divide and phase control mechanisms ensure that the BCLK, ADCLRC and DACLRC edges will occur in a predictable and repeatable position relative to each other and to the data for a given combination of DAC sample rate, ADC sample rate and BCLKDIV settings.

See Clocking and Sample Rates section for more information.

AUDIO DATA FORMATS

In Left Justified mode, the MSB is available on the first rising edge of BCLK following a LRCLK transition. The other bits up to the LSB are then transmitted in order. Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles before each LRCLK transition.

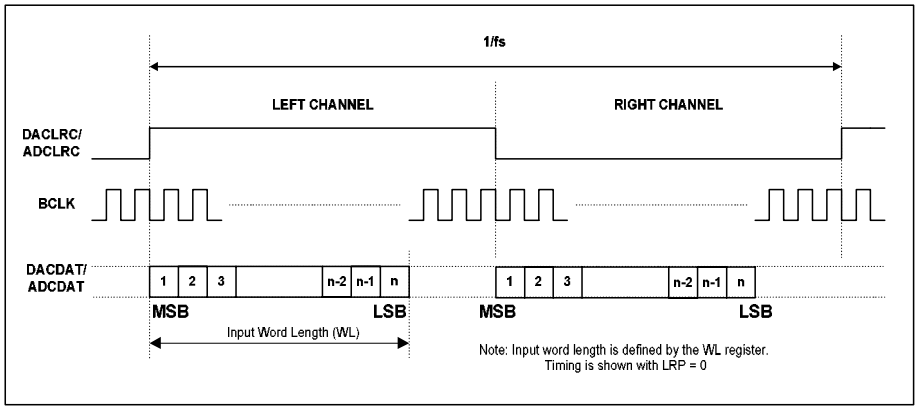

Figure 26 Left Justified Audio Interface (assuming n-bit word length)

In Right Justified mode, the LSB is available on the last rising edge of BCLK before a LRCLK transition. All other bits are transmitted before (MSB first). Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles after each LRCLK transition.

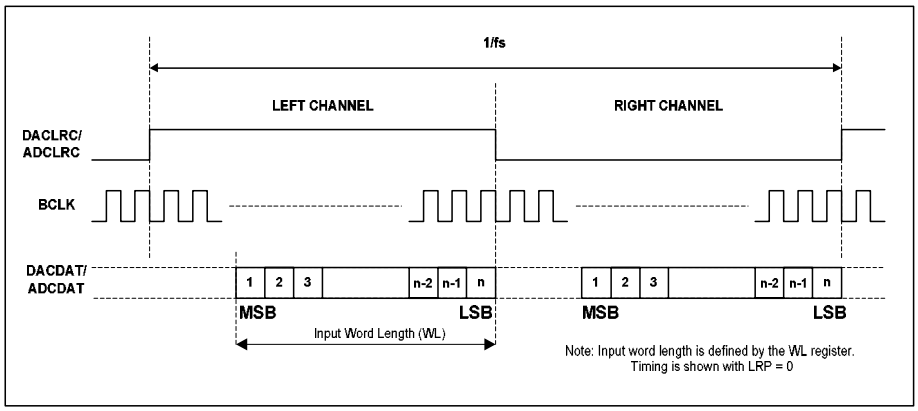

Figure 27 Right Justified Audio Interface (assuming n-bit word length)

In I^2S mode, the MSB is available on the second rising edge of BCLK following a LRCLK transition. The other bits up to the LSB are then transmitted in order. Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles between the LSB of one sample and the MSB of the next.

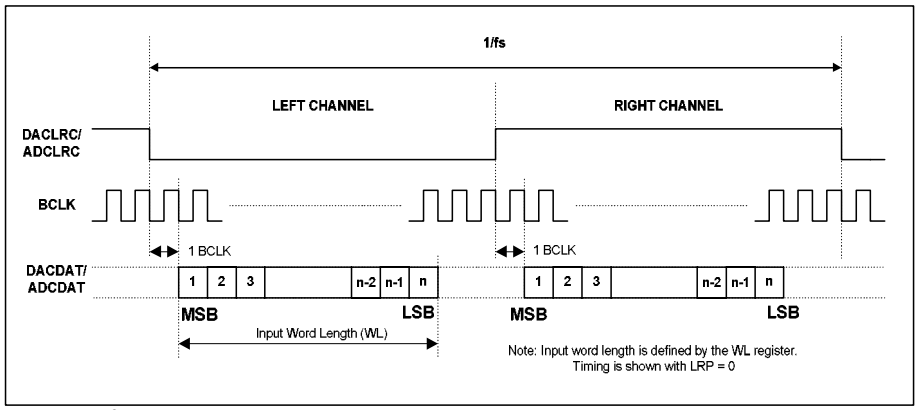

Figure 28 I²S Justified Audio Interface (assuming n-bit word length)

In DSP/PCM mode, the left channel MSB is available on either the 1st (mode B) or 2nd (mode A) rising edge of BCLK (selectable by LRP) following a rising edge of LRC. Right channel data immediately follows left channel data. Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles between the LSB of the right channel data and the next sample.

In device master mode, the LRC output will resemble the frame pulse shown in Figure 29 and Figure 30. In device slave mode, Figure 31 and Figure 32, it is possible to use any length of frame pulse less than 1/fs, providing the falling edge of the frame pulse occurs greater than one BCLK period before the rising edge of the next frame pulse.

AUDIO INTERFACE CONTROL

The register bits controlling audio format, word length and master / slave mode are summarised in Table 33. MS selects audio interface operation in master or slave mode. In Master mode BCLK, ADCLRC and DACLRC are outputs. The frequency of ADCLRC and DACLRC is set by the bits ADCDIV and DACDIV and the frequency of BCLK is set by the bits BCLKDIV (See "Clocking and Sample Rates"). In Slave mode BCLK, ADCLRC and DACLRC are inputs.

Note: Right Justified mode does not support 32-bit data.

AUDIO INTERFACE OUTPUT TRISTATE

Register bit TRIS, register 24(18h) bit[3] can be used to tristate the ADCDAT pin and switch ADCLRC, DACLRC and BCLK to inputs. In Slave mode (MS=0) ADCLRC, DACLRC and BCLK are by default configured as inputs and only ADCDAT will be tri-stated, (see Table 34).

When the ADCLRC/GPIO1 pin is configured as a GPIO, this pin will not be tristated by the TRIS register bit.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R24 (18h) Additional Control (2)	3	TRIS	0	Tristates ADCDAT and switches ADCLRC, DACLRC and BCLK to inputs. 0 = ADCDAT is an output; ADCLRC, DACLRC and BCLK are inputs (slave mode) or outputs (master mode) 1 = ADCDAT is tristated; DACLRC and BCLK are inputs; ADCLRC is an input (when not configured as a GPIO)

Table 34 Tri-stating the Audio Interface

MASTER MODE ADCLRC AND DACLRC ENABLE

In master mode, by default ADCLRC clock generator is disabled and will output a logic 0 when the ADCs are both disabled and DACLRC clock generator is disabled and will output a logic 0 when the DACs are both disabled.

Register bit LRCM, register 24 (18h) bit[2] changes the control so that the ADCLRC and DACLRC clock generators are both disabled only when both ADCs and both DACs are disabled. This enables the user to use e.g. ADCLRC for both ADC and DAC LRCLK and disable the ADC when DAC only operation is required, (see Table 35).

When ADCLRC is configured as a GPIO (using ALRCGPIO), DACLRC is used for the ADCs and the DACs and will only be disabled in master mode when both ADCs and both DACs are disabled.

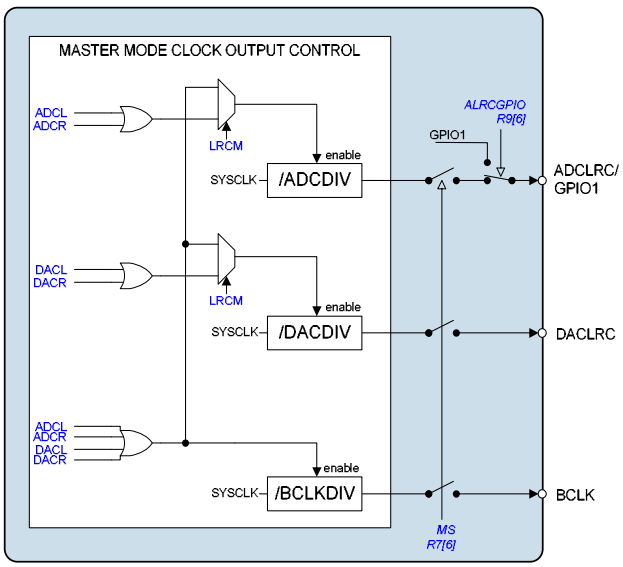

Figure 33 Master Mode Clock Ouput Control

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 35 ADCLRC/DACLRC Enable

COMPANDING

The WM8960 supports A-law and μ-law companding on both transmit (ADC) and receive (DAC) sides. Companding can be enabled on the DAC or ADC audio interfaces by writing the appropriate value to the DACCOMP or ADCCOMP register bits respectively.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R9 (09h) Audio Interface (2)	2:1	ADCCOMP	00	ADC companding 00 = off 01 = reserved 10 = μ-law 11 = A-law
	4:3	DACCOMP	00	DAC companding 00 = off 01 = reserved 10 = μ-law 11 = A-law
	5	WL8	0	0 = off 1 = device operates in 8-bit mode.

Table 36 Companding Control

Companding involves using a piecewise linear approximation of the following equations (as set out by ITU-T G.711 standard) for data compression:

μ-law (where μ=255 for the U.S. and Japan):

$F(x) = \ln(1 + \mu|x|) / \ln(1 + \mu)$ $-1 \le x \le 1$

A-law (where A=87.6 for Europe):

$F(x) = A|x| / (1 + \ln A)$ } for $x \le 1/A$

$F(x) = (1 + \ln A|x|) / (1 + \ln A)$ } for $1/A \le x \le 1$

The companded data is also inverted as recommended by the G.711 standard (all 8 bits are inverted for μ-law, all even data bits are inverted for A-law). The data will be transmitted as the first 8 MSB's of data.

Companding converts 13 bits (μ-law) or 12 bits (A-law) to 8 bits using non-linear quantization. The input data range is separated into 8 levels, allowing low amplitude signals better precision than that of high amplitude signals. This is to exploit the operation of the human auditory system, where louder sounds do not require as much resolution as quieter sounds. The companded signal is an 8-bit word containing sign (1-bit), exponent (3-bits) and mantissa (4-bits).

Setting the WL8 register bit allows the device to operate with 8-bit data. In this mode it is possible to use 8 BCLK cycles per LRC frame. When using DSP mode B, this allows 8-bit data words to be output consecutively every 8 BCLK cycles and can be used with 8-bit data words using the A-law and u-law companding functions.

BIT7	BIT[6:4]	BIT[3:0]
SIGN	EXPONENT	MANTISSA

Table 37 8-bit Companded Word Composition

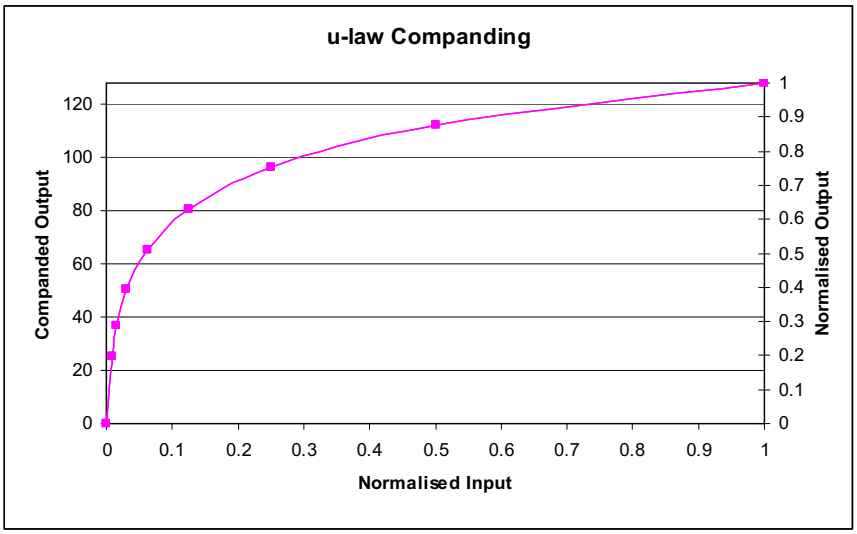

Figure 34 µ-Law Companding

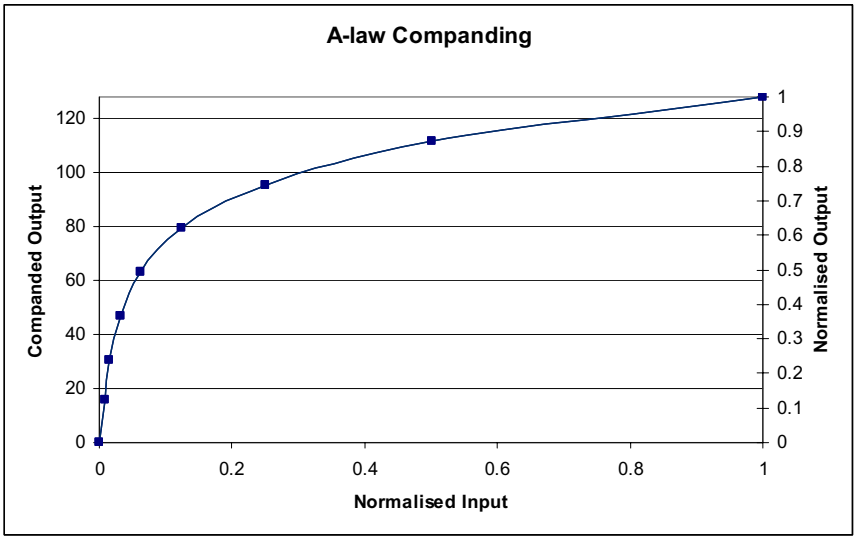

Figure 35 A-Law Companding

LOOPBACK

Setting the LOOPBACK register bit enables digital loopback. When this bit is set the output data from the ADC audio interface is fed directly into the DAC data input.

The ADCs and DACs must both use DACLRC when loopback is enabled. This is enabled by setting register bit ALRCGPIO = 1.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R9 Audio Interface	0	LOOPBACK	0	Digital Loopback Function 0 = No loopback. 1 = Loopback enabled, ADC data output is fed directly into DAC data input.

Table 38 Loopback Control

CLOCKING AND SAMPLE RATES

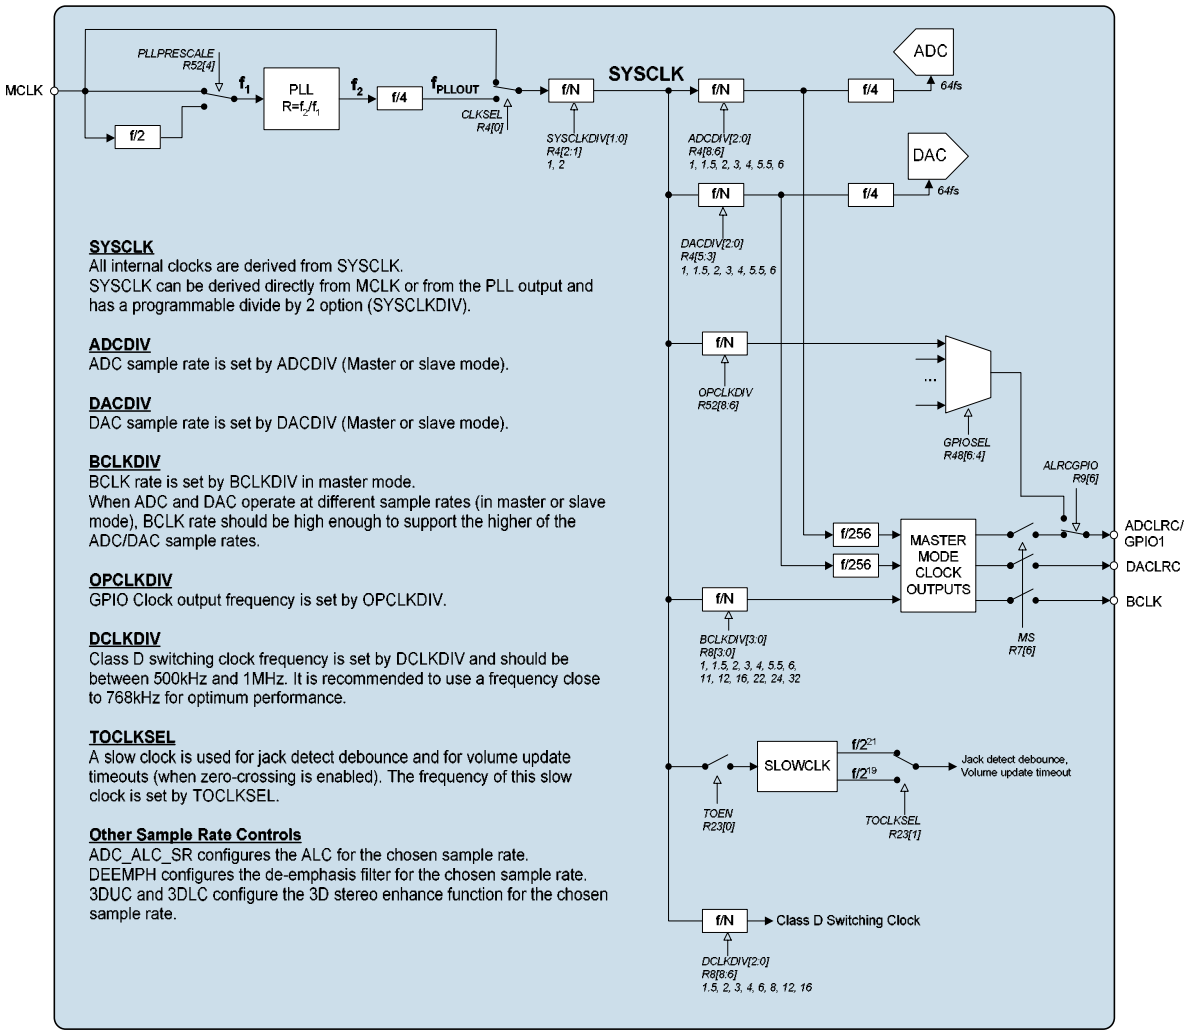

Figure 36 Clocking Scheme

Clocks for the ADCs and DACs, the DSP core functions, the digital audio interface and the class D outputs are all derived from SYSCLK as show in Figure 36.

SYSCLK can either be derived directly from MCLK, or generated from a PLL using MCLK as a reference. The clock source is selected by CLKSEL. Many commonly-used audio sample rates can be derived directly from MCLK, while the PLL provides additional flexibility.

The ADC and DAC sample rates are independently selectable, relative to SYSCLK, using ADCDIV and DACDIV. In master mode, BCLK is also derived from SYSCLK via a programmable clock divide (BCLKDIV).

When the ADCLRC/GPIO1 pin is configured as a GPIO, a clock derived from SYSCLK can be output on this pin to provide clocking for other parts of the system. The frequency of this output clock is set by OPCLKDIV.

A slow clock derived from SYSCLK is used to de-bounce the headphone detect function, and to set the timeout period for volume updates when zero-cross functions are used. This clock is enabled by TOEN and its frequency is set by TOCLKSEL.

The class D outputs require a clock, and this is also derived from SYSCLK via a programmable divider (DCLKDIV) as shown in Figure 36. The class D switching clock should be set between 700kHz and 800kHz.

The class D switching clock should not be disabled when the speaker outputs are active, as this would prevent the speaker outputs from functioning. The class D switching clock frequency should not be altered while the speaker outputs are active as this may generate an audible click.

Table 39 shows the clocking and sample rate controls for MCLK input, BITCLK output (in master mode), ADCs, DACs, class D outputs and GPIO clock output. Refer to Table 40 for example clocking configurations.

Table 40 ADC and DAC Sample Rates

Although the ADC and DAC can run at different sample rates, they share the same bit clock pin BCLK.

When operating in master mode, register bits BCLKDIV[3:0] should be set to an appropriate value to ensure that there are sufficient BCLK cycles to transfer the complete data word from the ADCs and to the DACs.

When operating in slave mode, the host device must provide sufficient BCLK cycles to transfer complete data words to the ADCs and DACs.

Table 41 shows the maximum word lengths supported for a given SYSCLK and BCLKDIV, assuming that either the ADCs or DACs are running at maximum rate (i.e. ADCDIV[2:0]=000 or DACDIV[2:0]=000).

SYSCLK (=MCLK OR PLL OUTPUT) (MHz)	BCLKDIV[3:0]	BCLK RATE (MASTER MODE) (MHz)	MAXIMUM WORD LENGTH (AT MAXIMUM ADC OR DAC SAMPLE RATE)

OTHER SAMPLE RATE CONTROL BITS

The ALC, de-emphasis filter and 3D stereo enhance functions all need to be configured for the chosen sample rate when in use, as show in Table 42.

ADC_ALC_SR should be configured to match the chosen ADC sample rate.

DEEMPH, 3DUC and 3DUC should be configured to match the chosen DAC sample rate.

PLL

The integrated PLL can be used to generate SYSCLK for the WM8960 or provide clocking for external devices via the GPIO1 pin.

The PLL is enabled by the PLLEN register bit.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R26 (1Ah) Power management (2)	0	PLLEN	0	PLL Enable 0 = PLL off 1 = PLL on
R52 (34h) PLL (1)	5	SDM	0	Enable Integer Mode 0 = Integer mode 1 = Fractional mode

Table 43 PLLEN Control Bit

The PLL frequency ratio R = f_2/f_1 (See Figure 36) can be set using the register bits PLLK and PLLN:

PLLN = int R

PLLK = int (2^{24} (R-PLLN))

EXAMPLE:

MCLK=12MHz, required clock = 12.288MHz.

R should be chosen to ensure 5 < PLLN < 13. There is a fixed divide by 4 in the PLL and a selectable divide by N after the PLL which should be set to divide by 2 to meet this requirement.

Enabling the divide by 2 sets the required f_2 = 4 x 2 x 12.288MHz = 98.304MHz.

R = 98.304 / 12 = 8.192

PLLN = int R = 8

k = int (2^{24} x (8.192 – 8)) = 3221225 = 3126E9h

Table 46 Example Clocking Schemes

CONTROL INTERFACE

2-WIRE SERIAL CONTROL INTERFACE

The WM8960 is controlled by writing to registers through a 2-wire serial control interface. A control word consists of 16 bits. The first 7 bits (B15 to B9) are address bits that select which control register is accessed. The remaining 9 bits (B8 to B0) are data bits, corresponding to the 9 bits in each control register. Many devices can be controlled by the same bus, and each device has a unique 7-bit address (this is not the same as the 7-bit address of each register in the WM8960).

The device address is 0011010 (**0x34h**).

The WM8960 operates as a slave device only. The controller indicates the start of data transfer with a high to low transition on SDIN while SCLK remains high. This indicates that a device address and data will follow. All devices on the 2-wire bus respond to the start condition and shift in the next eight bits on SDIN (7-bit address + Read/Write bit, MSB first). If the device address received matches the address of the WM8960 and the R/W bit is '0', indicating a write, then the WM8960 responds by pulling SDIN low on the next clock pulse (ACK). If the address is not recognised or the R/W bit is '1', the WM8960 returns to the idle condition and wait for a new start condition and valid address.

Once the WM8960 has acknowledged a correct address, the controller sends the first byte of control data (B15 to B8, i.e. the WM8960 register address plus the first bit of register data). The WM8960 then acknowledges the first data byte by pulling SDIN low for one clock pulse. The controller then sends the second byte of control data (B7 to B0, i.e. the remaining 8 bits of register data), and the WM8960 acknowledges again by pulling SDIN low.

The transfer of data is complete when there is a low to high transition on SDIN while SCLK is high. After receiving a complete address and data sequence the WM8960 returns to the idle state and waits for another start condition. If a start or stop condition is detected out of sequence at any point during data transfer (i.e. SDIN changes while SCLK is high), the device jumps to the idle condition.

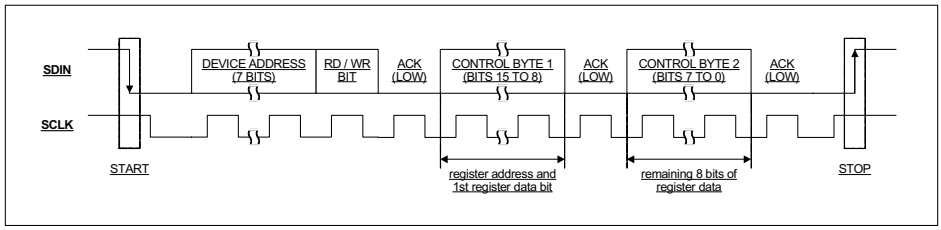

Figure 37 2-Wire Serial Control Interface

POWER MANAGEMENT

The WM8960 has three control registers that allow users to select which functions are active. For minimum power consumption, unused functions should be disabled. To avoid any pop or click noise, it is important to enable or disable functions in the correct order (see Applications Information). VMIDSEL is the enable for the Vmid reference, which defaults to disabled and can be enabled as a 2x50kΩ potential divider or, for low power maintenance of Vref when all other blocks are disabled, as a 2x250kΩ potential divider.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R25 (19h) Power Management (1)	8:7	VMIDSEL	00	Vmid Divider Enable and Select 00 = Vmid disabled (for OFF mode) 01 = 2 x 50kΩ divider enabled (for playback / record) 10 = 2 x 250kΩ divider enabled (for low-power standby) 11 = 2 x 5kΩ divider enabled (for fast start-up)

	2	ROMIX		Right Output Mixer Enable 0 = Power down 1 = Power up

Table 47 Power Management

STOPPING THE MASTER CLOCK

In order to minimise power consumed in the digital core of the WM8960, the master clock may be stopped in Standby and OFF modes. If this cannot be done externally at the clock source, the DIGENB bit (R25, bit 0) can be set to stop the MCLK signal from propagating into the device core. In Standby mode, setting DIGENB will typically provide an additional power saving on DCVDD of 20uA. However, since setting DIGENB has no effect on the power consumption of other system components external to the WM8960, it is preferable to disable the master clock at its source wherever possible.

MCLK should not be stopped while the class D outputs are enabled, as this would prevent the outputs from functioning.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R25 (19h) Additional Control (1)	0	DIGENB	0	Master clock disable 0 = Master clock enabled 1 = Master clock disabled

Table 48 Enabling the Master Clock

NOTE: Before DIGENB can be set, the control bits ADCL, ADCR, DACL and DACR must be set to zero and a waiting time of 1ms must be observed. Any failure to follow this procedure may prevent DACs and ADCs from re-starting correctly.

SAVING POWER AT HIGHER SUPPLY VOLTAGE

The AVDD supply of the WM8960 can operate beteen 2.7V and 3.6V. By default, all analogue circuitry on the device is optimized to run at 3.3V. This set-up is also good for all other supply voltages down to 2.7V. At lower voltages, performance can be improved by increasing the bias current by setting VSEL[1:0] = 01. If low power operation is preferred the bias current can be left at the default setting. This is controlled as shown below.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R23 (17h) Additional Control (1)	7:6	VSEL [1:0]	11	Analogue Bias Optimisation 00 = Reserved 01 = Increased bias current optimized for AVDD=2.7V 1X = Lowest bias current, optimized for AVDD=3.3V

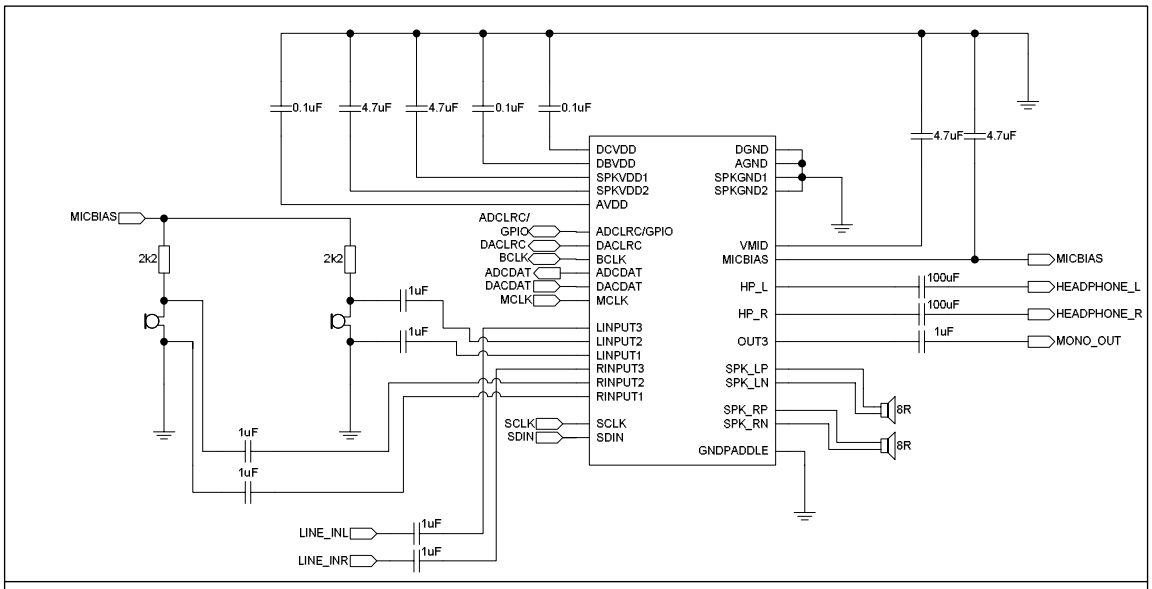
APPLICATIONS INFORMATION

RECOMMENDED EXTERNAL COMPONENTS



Notes:
1. AGND and DGND should be connected as close to the WM8960 as possible.
2. Supply decoupling capacitors on DCVDD, DBVDD, SPKVDD and AVDD shoule be positioned as close to the WM8960 as possible.
3. Capacitor types should be carefully chosen. Capacitors with very low ESR are recommended for optimum performance.
4. Microphone common mode noise performance can be improved by adding resistors from the microphone negative terminal to ground.
5. The speakers should be connected as close as possible to the WM8960. When this is not possible, filtering should be placed on the speaker outputs close the the WM8960.

SPEAKER SELECTION

For filterless operation, it is important to select a speaker with appropriate internal inductance. The internal inductance and the speaker's load resistance create a low-pass filter with a cut-off frequency of:

$$f_c = R_L / 2\pi L$$

e.g. for an 8Ω speaker and required cut-off frequency of 20kHz, the speaker should be chosen to have an inductance of:

$$L = R_L / 2\pi f_c = 8\Omega / 2\pi * 20kHz = 64\mu H$$

8Ω speakers typically have an inductance in the range 20μH to 100μH. Care should be taken to ensure that the cut-off frequency of the speaker's internal filtering is low enough to prevent speaker damage. The class D outputs of the WM8960 operate at much higher frequencies than is recommended for most speakers, and the cut-off frequency of the filter should be low enough to protect the speaker.

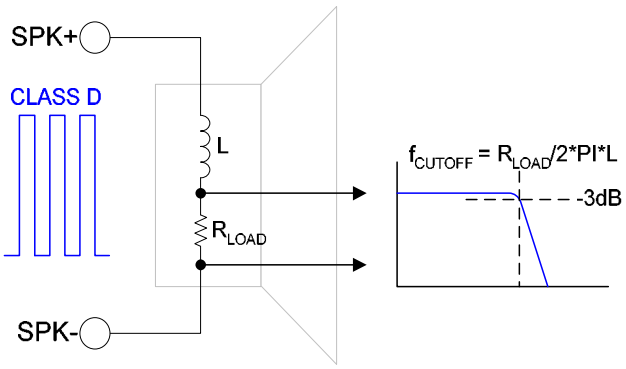


Figure 50 Speaker Equivalent Circuit

PCB LAYOUT CONSIDERATIONS

The efficiency of the speaker drivers is affected by the series resistance between the WM8960 and the speaker (e.g. inductor ESR) as shown in Figure 51. This resistance should be as low as possible to maximise efficiency.

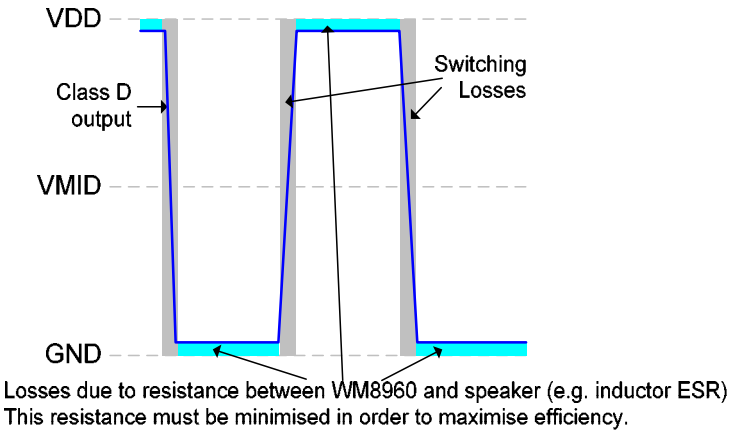

Figure 51 Speaker Connection Losses

The distance between the WM8960 and the speakers should be kept to a minimum to reduce series resistance, and also to reduce EMI. Further reductions in EMI can be achieved by additional passive filtering and/or shielding as shown in Figure 52. When additional passive filtering is used, low ESR components should be chosen to minimise series resistance between the WM8960 and the speaker, maximising efficiency.

LC passive filtering will usually be effective at reducing EMI at frequencies up to around 30MHz. To reduce emissions at higher frequencies, ferrite beads placed as close to the device as possible will be more effective.

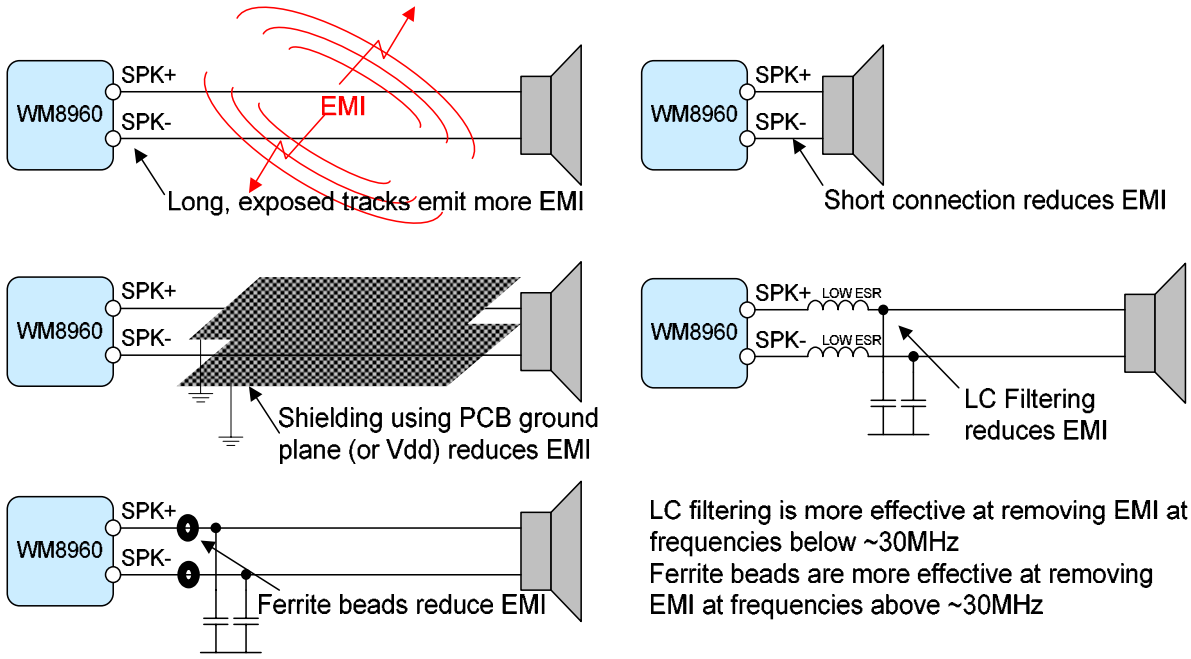

Figure 52 EMI Reduction Techniques

REF:	JEDEC, MO-220, VARIATION VHHD-5.			

NOTES:
1. DIMENSION b APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.15 mm AND 0.30 mm FROM TERMINAL TIP.
2. FALLS WITHIN JEDEC, MO-220, VARIATION VHHD-5.
3. ALL DIMENSIONS ARE IN MILLIMETRES.
4. THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JEDEC 95-1 SPP-002.
5. COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
6. REFER TO APPLICATION NOTE WAN_0118 FOR FURTHER INFORMATION REGARDING PCB FOOTPRINTS AND QFN PACKAGE SOLDERING.
7. THIS DRAWING IS SUBJECT TO CHANGE WITHOUT NOTICE.

IMPORTANT NOTICE

Wolfson Microelectronics plc ("Wolfson") products and services are sold subject to Wolfson's terms and conditions of sale, delivery and payment supplied at the time of order acknowledgement.

Wolfson warrants performance of its products to the specifications in effect at the date of shipment. Wolfson reserves the right to make changes to its products and specifications or to discontinue any product or service without notice. Customers should therefore obtain the latest version of relevant information from Wolfson to verify that the information is current.

Testing and other quality control techniques are utilised to the extent Wolfson deems necessary to support its warranty. Specific testing of all parameters of each device is not necessarily performed unless required by law or regulation.

In order to minimise risks associated with customer applications, the customer must use adequate design and operating safeguards to minimise inherent or procedural hazards. Wolfson is not liable for applications assistance or customer product design. The customer is solely responsible for its selection and use of Wolfson products. Wolfson is not liable for such selection or use nor for use of any circuitry other than circuitry entirely embodied in a Wolfson product.

Wolfson's products are not intended for use in life support systems, appliances, nuclear systems or systems where malfunction can reasonably be expected to result in personal injury, death or severe property or environmental damage. Any use of products by the customer for such purposes is at the customer's own risk.

Wolfson does not grant any licence (express or implied) under any patent right, copyright, mask work right or other intellectual property right of Wolfson covering or relating to any combination, machine, or process in which its products or services might be or are used. Any provision or publication of any third party's products or services does not constitute Wolfson's approval, licence, warranty or endorsement thereof. Any third party trade marks contained in this document belong to the respective third party owner.

Reproduction of information from Wolfson datasheets is permissible only if reproduction is without alteration and is accompanied by all associated copyright, proprietary and other notices (including this notice) and conditions. Wolfson is not liable for any unauthorised alteration of such information or for any reliance placed thereon.

Any representations made, warranties given, and/or liabilities accepted by any person which differ from those contained in this datasheet or in Wolfson's standard terms and conditions of sale, delivery and payment are made, given and/or accepted at that person's own risk. Wolfson is not liable for any such representations, warranties or liabilities or for any reliance placed thereon by any person.
