

Description

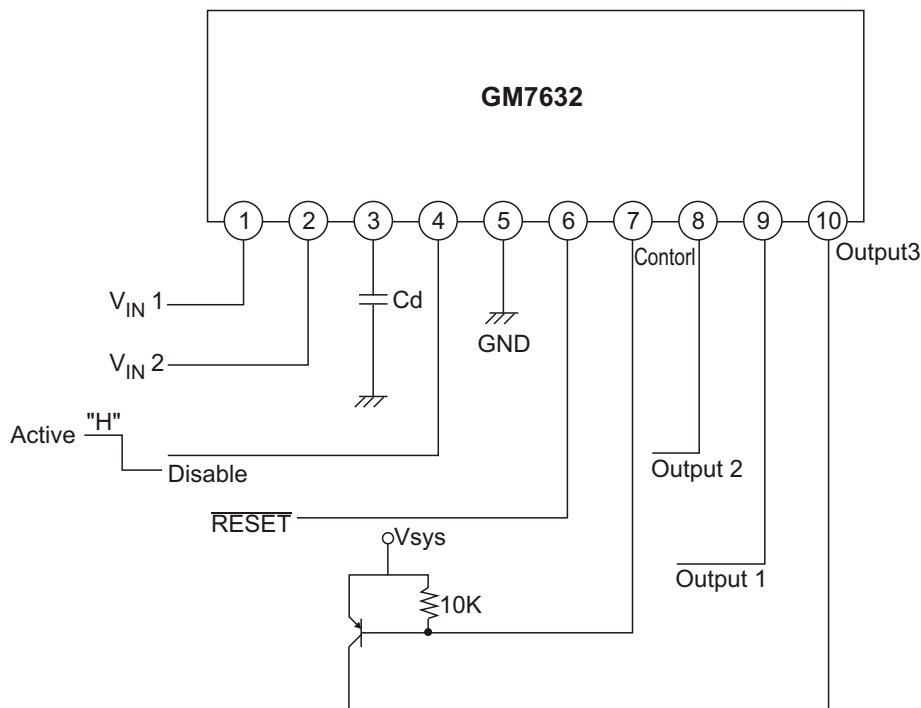

GM7632 is a multi-output positive voltage regulator designed to provide fixed precision output voltages of 3.3V, 8V at current up to 0.5A and 5.1V at current up to 1A with external PNP transistor.

An internal reset circuit generates a reset pulse when the output 1 decrease below the regulated value. Output2 & 3 can be disabled by TTL input. Protection features include over voltage protection, short circuit protection and thermal shutdown.

Features

- ◆ Output Currents up to 0.5A (output1 & 2)
- ◆ Output Current up to 1A with External Transistor (output3)
- ◆ Fixed Precision Output 1 voltage $3.3V \pm 2\%$
- ◆ Fixed Precision Output 2 voltage $8V \pm 2\%$ (GM7632)
- ◆ Control Signal Generator for Output 3 voltage ($5.1V \pm 2\%$)
- ◆ Reset Facility for Output Voltage1
- ◆ Output 2,3 with Disable by TTL Input
- ◆ Current Limit Protection at Each Output
- ◆ Thermal Shut Down

Reset Threshold Hysteresis	Vrth	Note 1	20	50	100	mA

Notes:

- To check the reset circuit, the reset output is low to discharge the delay capacitor(=Cd). if it's less than $V_{O1}-0.25V$. And the reset output is high when the delay capacitor voltage linearly increased by the internal current source(10 μA) if it's more than $V_{O1}-0.2V$. The equations of delay time is same as below. $Trd = (Cd \times 2.5) / 10\mu A$
- Although guaranteed, these parameters are not 100% tested in production.
