

RC288ACi/VFC, RC240ACi/VFC and RC192ACi/VFC Integrated V.Fast Class™(V.FC™) Data and Fax **Modem Device Set Family**

INTRODUCTION

The Rockwell V.Fast Class™ (V.FC™) integrated modem device set family supports ultra high speed data and high speed fax operation. Models are provided that meet different requirements for data throughput and options (Table 1). Each model consists of modem data pump and controller devices and supporting firmware.

As a data modem, the modem operates at line speeds to bps (RC288ACi/VFC), 24000 bps (RC240ACi/VFC), or 19200 bps (RC192ACi/VFC). Error correction (V.42/MNP 2-4) and data compression (V.42 bis/MNP 5) maximize data transfer integrity and boost data throughput up to 115.2 kbps, 96 kbps, or 76.8 kbps. The modem also operates in non-error-correcting mode.

As a fax modem, the modem supports Group 3 send and receive rates up to 14400 bps and supports T.30 protocol.

Extended "AT" commands provide data, fax class 1 and class 2, MNP 10, and world-class functions while using minimal external ROM, RAM, and optional NVRAM. Models supporting US/Canada and multiple countries with different memory requirements are available (Table 1).

The modem operates over a dial-up telephone line, can auto-dial and auto-answer, and can operate in both synchronous and asynchronous modes. Configuration information can be stored in non-volatile memory.

Two system architectures are supported: a low cost configuration using a single microcontroller and a high performance configuration employing an added co-processor.

A PC-based "ConfigurACE™" utility program can be used to customize the MCU firmware to specific application and country requirements.

With its small size, this modem device set is ideal for desktop applications.

Accelerator kits are available to minimize application design time and costs.

V.Fast Class, V.FC, and ConfigurACE are trademarks of Rockwell

MNP is a trademark of Microcom Systems, Inc.

Hayes is a trademark of Hayes Microcomputer Products, Inc.

FEATURES

- Data modern throughput up to 115.2 kbps
 - -V.Fast Class (v.FC), V.32 bis, V.32, V.22 bis, V.22A/B, V.23, and V.21; Bell 212A and 103
 - —V.42 LAPM and MNP 2-4 error correction
 - -V.42 bis and MNP 5 data compression
- MNP 10 data throughput enhancement (to V.32 bis)
- Fax modem send and receive rates up to 14400 bps -V.17, V.29, V.27 ter, and V.21 channel 2
- World-class operation (option)
 - -V.25 bis commands (asynchronous only)
 - -Call progress and blacklisting parameters
 - -Multiple country support
- Hayes AutoSync (option)
- ConfigurACE utility program
- Communication software compatible command sets
 - -AT, fax class 1, and fax class 2 commands
 - —S registers
- Built-in DTE interfaces
 - -DTE speed up to 115.2 kbps
 - -Parallel 16550A UART-compatible interface
 - -Serial CCITT V.24 (EIA/TIA-232-E)
- · Line quality monitoring and auto retrain
- NVRAM directory and stored profiles
- Flow control and speed buffering
- Automatic format/speed sensing
- Serial synchronous and asynchronous data
- Parallel asynchronous data
- Auto dial and auto answer
- Tone, pulse, and adaptive dialing
- Calling Number Delivery (Caller ID) detect
- Diagnostics
- · Extended operating temperature models available
- +5V operation
- · Typical power consumption:

Mode	Low Cost (Without CEP)	High Performance (With CEP)
Operating	1.07 W	1.22 W
Sleep	21 mW	32 mW
Ston	11 mW	12 mW

CMOS VLSI devices

-MCU: 84-pin PLCC -CEP: 84-pin PLCC -MDP: 68-pin PLCC

Notes:

1. Option notations:

-D Data only (no fax).
W World class support.

(/A) Optional AutoSync support.

(E) Optional industrial temperature range.

2. Supported functions (A = Optionally supported; S = Supported; - = Not supported):

Fax Fax class 1 and class 2 command functions.

MNP 10 Data throughput enhancement functions.

W-Class World class functions supporting multiple country requirements. AutoSync Hayes AutoSync available with 128k-byte ROM installed.

3. Configuration dependent:

32k bytes in low cost configuration;

40k bytes in high performance configuration (8k bytes on the MCU external bus, 32k bytes on the CEP external bus).

2

TECHNICAL OVERVIEW

GENERAL DESCRIPTION

The modem device set provides the processing core of the modem. The OEM adds external memory, crystal, discrete components, and a digital access arrangement (DAA) circuit to complete the modem system.

System Configurations

High Performance. The modem device set consists of a L39 Microcontroller (MCU), a Modem Data Pump (MDP), and a Compression Expansion Processor (CEP). This configuration provides maximum bidirectional data throughput.

In this configuration, the OEM provides external memory for the MCU (64k/128k bytes ROM and 8k bytes RAM) and for the CEP (8k bytes ROM [initial code release only] and 32k bytes RAM).

Low Cost. The modem device set consists of a L39 MCU and a MDP.

In this configuration, the OEM provides external memory only for the MCU (64k/128k bytes ROM and 32k bytes RAM).

Modem Data Pump (MDP)

The MDP is a Rockwell RC288DPi/VFC, RC240DPi/VFC, or RC192DPi/VFC 2-wire data/fax modem data pump packaged in a 68-pin PLCC.

As a data modem, the MDP can operate in full-duplex, synchronous/asynchronous modes at line rates up to 28800 bps. Using a proprietary scheme to optimize modem configuration for line conditions, the MDP can connect at the highest data rate that the channel can support from 28800 bps (RC288DPi/VFC), 24000 bps (RC240DPi/VFC), or 19200 bps (RC192ACi/VFC) to 14400 bps with automatic fallback. Automode operation in V.32 bis is provided in accordance with EIA/TIA-PN2330.

As a fax modem, the MDP fully supports Group 3 facsimile send and receive speeds of 14400, 12000, 9600, 7200, 4800, and 2400 bps.

Microcontroller (MCU)

The MCU is a Rockwell L39 microcomputer packaged in a 84-pin PLCC. The MCU performs the command processing and host interface functions.

The MCU connects to the host via a V.24 (EIA/TIA-232-E) serial interface or a parallel microcomputer bus. The MCU connects to the MDP via dedicated lines and the external bus. The MCU external bus also connects to OEM-supplied ROM and RAM and, high performance configuration, to the CEP. The MCU external bus also connects to OEM-supplied ROM (64k bytes for US/Canada models or to a 128k bytes for models supporting MNP 10, W-class, or AutoSync functions) and to RAM (32k bytes for the low cost configuration or 8k bytes for the high performance configuration).

For W-class models, buffered switch inputs and latched indicator/control outputs can optionally be connected to the MCU external bus.

For all models, 256 bytes NVRAM can optionally be connected to the MCU over a dedicated serial interface.

Low Cost Configuration. The MCU connects to the MDP and to external memory over the MCU external bus. The MCU crystal frequency is 14.7456 MHz. The MCU external memory is 64k or 128k bytes ROM (45 ns) and 32k bytes RAM (45 ns).

High Performance Configuration. The MCU connects to the MDP, external memory, and to the CEP over the MCU external bus. The use of CEP in this configuration allows the MCU to operate slower which also permits the use of slower memory connected to the MCU bus. The MCU crystal frequency is 12.9024 MHz. The MCU external memory is 64k or 128k bytes ROM (55 ns) and 8k bytes RAM (55 ns).

Compression Expansion Processor (CEP)

The CEP performs the dedicated data compression and expansion functions in V.42 bis/MNP 5 modes to provide maximum bidirectional throughput for high performance operation. The CEP is packaged in a 84-pin PLCC.

The CEP host interface connects to the MCU external bus and the CEP external memory bus connects to 32k bytes RAM (55 ns) and 8k bytes ROM (55 ns). The external ROM for the CEP is required only for initial CEP code release. The CEP crystal frequency is 12.9024 MHz.

MCU Firmware

MCU firmware performs processing of general modem control, command sets, error correction, MNP 10, fax class 1 and class 2, and DTE interface functions. The MCU firmware is provided by Rockwell in object code form for the OEM to program into external ROM. The MCU firmware may also be provided in source code form under a source code addendum license agreement.

CEP Firmware

CEP firmware is provided by Rockwell in object code form for the OEM to program into an external 8k-byte ROM for initial CEP product. Later CEP products may incorporate the firmware internally thus eliminating the requirement for the external 8k-byte ROM.

SUPPORTED INTERFACES

The major hardware signal interfaces of the modern device set are illustrated in Figure 1.

Parallel Host Bus Interface

A 16550A UART-compatible parallel interface is provided. Eight data lines, three address lines, and nine control lines are supported.

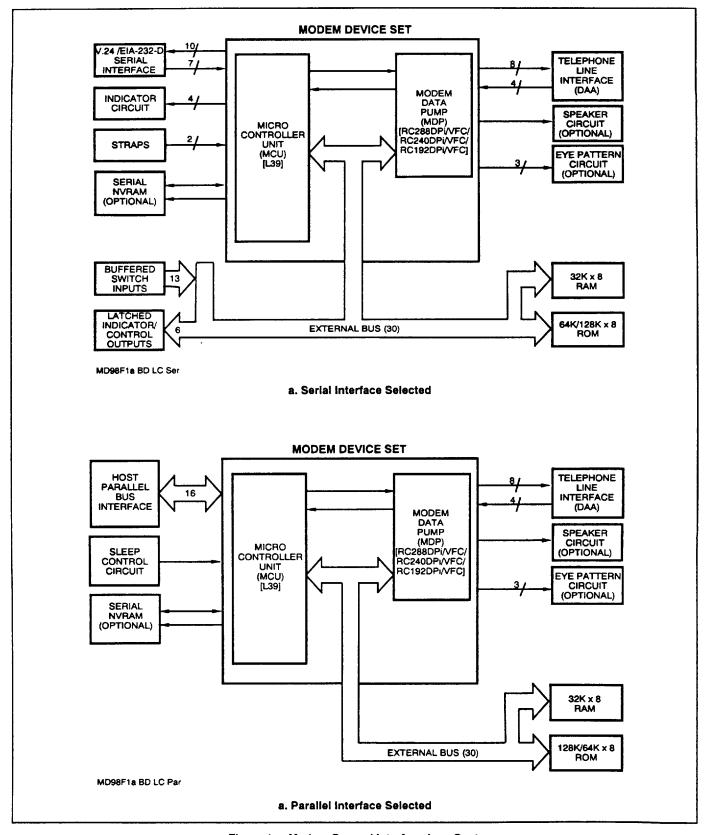

Figure 1a. Modem General Interface-Low Cost

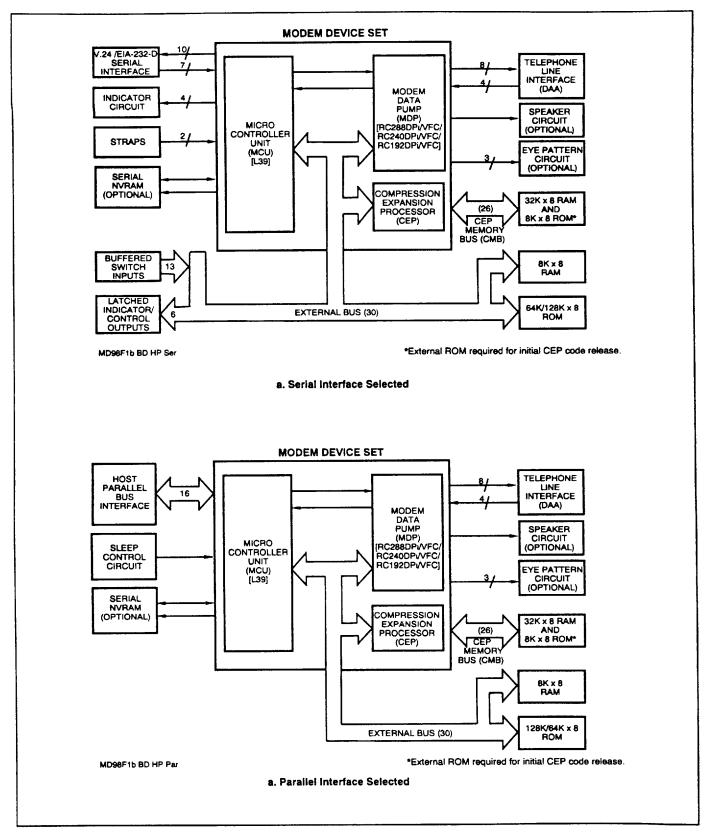

Figure 1b. Modem General Interface-High Performance

■ 7811073 0022398 496 **■**

Serial/Switch/Indicator Interface

A DTE serial interface, direct connect and bit mapped switch inputs, and indicator/control outputs are supported.

Serial Interface. A 16-line V.24 and EIA/TIA-232-E logic-compatible serial interface to the DTE is supported. A clock stop output signal is provided which can be used to turn off transmitter and receiver clocks to the DTE in asynchronous modes.

Switch Interface. A direct connect strap input can be samp ad. Thirteen switch inputs, bit-mapped through an external three-state buffer, can be sampled in the world-class (W-class) configuration.

Indicator Interface. Four direct connect indicator outputs are supported. Six indicator outputs, bit-mapped through an external latch, are supported in W-class configurations.

Stop Mode Control

The STPMODE input is supported which controls modem entry into Stop Mode.

NVRAM Interface

A serial interface to the optional OEM-supplied 256-byte non-volatile RAM (NVRAM) is provided. Data stored in NVRAM can take precedence over the factory default settings. The 256-byte NVRAM can store up to two user-selectable configurations and can store up to four 45-digit dial strings.

Speaker Interface

A speaker output, controlled by AT or V.25 bis commands, is provided for an optional OEM-supplied speaker circuit.

MCU External Bus Interface

The MCU external bus connects to the MDP, ROM, RAM, and, for W-class configuration, a switch input buffer and indicator output latches. In the high performance configuration, MCU also connects to the CEP. The non-multiplexed bus supports eight bidirectional data lines and 17 address lines. Dedicated MDP, ROM, RAM, and CEP chip select and control outputs, as well as indicator/control device chip select outputs, are also provided.

Line Interface

MDP. The MDP connects to the line interface circuitry via a receive analog input, two transmit analog outputs, a relay driver output, and a ring signal input. The relay output may be used to drive the Caller ID relay.

MCU. The MCU provides four relay control outputs to the line interface. These outputs may be used to control relays such as off-hook, pulse, mute, A/A1, earth, and talk/data. The MCU accepts ring signal and line current sense from the line interface.

Eye Pattern Generator Interface

Eye pattern data, clock, and sync interface signals are provided to allow an external eye pattern generator circuit to be easily added in order to observe modem performance relative to line impairments.

COMMANDS

The modem supports data modem, fax class 1 and 2, MNP 10, and W-class commands and S Registers (see Tables 2 and 3, respectively) depending on the modem model.

Data Modem Operation. Data modem functions operate in response to the basic AT commands when +FCLASS=0. Default parameters support US/Canada operation.

MNP 10 Operation (Option). MNP 10 functions operate in response to MNP 10 commands.

AutoSync Operation (Option). AutoSync operates in response to the &Q4 command.

World Class (W-Class) Operation. W-class functions operate in response to W-class AT and V.25 bis commands.

Fax Modem Operation (Option). Facsimile functions operate in response to fax class 1 commands when +FCLASS=1 or to fax class 2 commands when +FCLASS=2.

DATA MODEM OPERATION

Automatic Speed/Format Sensing (Serial Interface)

The modem can automatically determine the speed and format of the data sent from the DTE (serial interface only). The modem can sense speeds of 300, 600, 1200, 2400, 4800, 7200, 9600, 12000, 14400, 16800, 19200, 21600, 24000, 26400, 28800, 38400, 57600, and 115200 bps and the following data formats:

Parity	Data Length (No. of Bits)	No. of Stop Bits	Character Length (No. of Bits)
None	7	2	10
Odd	7	1	10
Even	7	1	10
None	8	1	10
Odd	8	1	11 *
Even	8	1	11 *

* 11-bit characters are sensed, but the parity bits are stripped off during data transmission in Normal and Error Correction modes. Direct mode does not strip off the parity bits.

The modem can speed sense data with mark or space parity and configures itself as follows:

DTE Configuration	Modem Configuration
7 mark	7 none
7 space	8 none
8 mark	8 none
8 space	8 even

ESTABLISHING DATA MODEM CONNECTIONS

Note: Default parameter values support modem operation in the U.S. For modem use in a different country, parameter values can be changed using ConfigureACE.

Telephone Number Directory

6

The modern supports four telephone number entries in a directory that can be saved in a serial NVRAM. Each telephone number can be up to 45 characters in length. A telephone number can be saved using the &Zn=x com-

mand and a saved telephone number can be dialed using the DS=n command.

Dialing

DTMF Dialing. DTMF dialing using DTMF tone pairs is supported in accordance with CCITT Q.23. The transmit tone level complies with Bell Publication 47001.

Pulse Dialing. Pulse dialing is supported in accordance with EIA/TIA-496-A.

Adaptive Dialing. If DTMF dialing is selected (T command) and the telephone network will not recognize DTMF tones, the modem will switch to pulse dialing. If pulse dialing is selected (P command), pulse dialing will be used.

Blind Dialing. The modem can blind dial in the absence of a dial tone if enabled by the X0, X1, or X3 command.

Modem Handshaking Protocol

If a tone is not detected within the time specified in the S7 register after the last digit is dialed, the modern aborts the call attempt.

Call Progress Tone Detection

Ringback, equipment busy, and progress tones can be detected in accordance with the applicable standard.

Answer Tone Detection

Answer tone detection can be detected over the frequency range of 2100 \pm 40 Hz in CCITT modes and 2225 \pm 40 Hz in Bell modes.

Ring Detection

A ring signal can be detected from a TTL-compatible 15.3 Hz to 68 Hz square wave input.

Billing Protection

When the modem goes off-hook to answer an incoming call, both transmission and reception of data are prevented for 2 seconds (data modem) or 4 seconds (fax adaptive answer) to allow transmission of the billing signal.

Connection Speeds

The modem functions as a data modem when the +FCLASS=0 command is active. The possible data connection modes/speeds are listed in Table 4. Two methods of establishing a connection are supported: use of the F command and use of N command, speed sense, and S37 register combination.

Automode

Automode detection can be enabled by the N1 or F0 commands to allow the modem to connect to a remote modem in V.FC mode or in accordance with EIA/TIA-PN2330.

DATA MODE

Data mode exists when a telephone line connection has been established between modems and all handshaking has been completed.

MD98C1

Speed Buffering (Normal Mode)

Speed buffering allows a DTE to send to, and receive data from, a modern at a speed different than the line speed. The modern supports speed buffering at all line speeds.

Flow Control

DTE-to-Modem Flow Control. If the modem-to-line speed is less than the DTE-to-modem speed, the modem supports XOFF/XON or RTS/CTS flow control with the DTE to ensure data integrity.

Mo .em-to-Modem Flow Control. When enabled by the \G1 command, the modem supports XON/XOFF flow control with the remote modem to ensure data integrity. Modem-to-modem flow control is not used in error correction mode. In this case, flow control is accomplished within the error-correction protocol.

Escape Sequence Detection

The "+++" escape sequence with guard time can be used to return control to the command mode from the data mode. Escape sequence detection is disabled by a S2 Register value greater than 127. Escape sequence detection is disabled in synchronous mode.

BREAK Detection

The modem can detect a BREAK signal from either the DTE or the remote modem. The \Kn command determines the modem response to a received BREAK signal.

Telephone Line Monitoring

GSTN Cleardown (V.FC, V.32 bis, V.32). Upon receiving GSTN Cleardown from the remote modem in a non-error correcting mode, the modern cleanly terminates the call.

Loss of Carrier. If carrier is lost for a time greater than specified by the S10 register, the modem will disconnect.

Receive Space Disconnect. If selected by the Y1 command in non-error-correction mode, the modem will disconnect after receiving 1.6 \pm 10% seconds of continuous SPACE.

Table 4. Connection Speed Options

Configuration	Rate
V.FC	28800 ¹ , 26400 ¹ , 24000 ² , 21600 ² ,
	19200, 16800, or 14400 bps
V.32 bis	14400, 12000, 9600, 7200,
	or 4800 bps
V.32	9600 or 4800 bps
V.22 bis	2400 or 1200 bps
V.22	1200 bps
V.23	1200Tx/75Rx or 75Tx/1200Rx
V.21	0-300 bps
Bell 212A	1200 bps
Bell 103	0-300 bps

Notes:

9

- 1. RC288ACi/VFC.
- 2. RC288ACi/VFC and RC240ACi/VFC.

Send SPACE on Disconnect

If selected by the Y1 command in non-error-correction mode, the modern will send $4 \pm 10\%$ seconds of continuous SPACE when a locally commanded hang-up is issued by the &Dn or H command.

Fall Forward/Fallback (V.FC, V.32 bis/V.32)

During initial handshake, the modem will fallback to the optimal line connection within V.FC mode if the remote modem is a V.FC modem, or within V.32 bis/V.32 mode if the remote modem is a V.32 bis/V.32 modem, depending upon signal quality if automode is enabled by the N1 command.

When connected in V.FC or V.32 bis/V.32 mode, the modem will fall forward or fallback to the optimal line speed within the connected mode depending upon signal quality if fall forward/fallback is enabled by the %E2 command.

Retrain

The modem may lose synchronization with the received line signal under poor line conditions. If this occurs, retraining may be initiated to attempt recovery depending on the type of connection.

The modem initiates a retrain if line quality becomes unacceptable if enabled by the %E command. The modem continues to retrain until an acceptable connection is achieved or until 30 seconds elapse which will result in telephone line disconnect.

Synchronous Data Mode (Serial Interface Only)

The modem can establish a synchronous connection in accordance with the &Mn or &Qn commands. Upon completing the physical handshake, the modem enters synchronous data mode. The inactivity timer is not used during synchronous data mode.

Direct Mode (Serial Interface Only)

The Direct mode allows data to be transmitted and received directly from the DTE and remote modem. The Direct mode is selected with the &Q0 or \N1 command. In Direct mode, no flow control characters are recognized or transmitted, the modem cannot execute error correction, and the inactivity timer is not used. Speed buffering is disabled in Direct mode.

Programmable Inactivity Timer

The modem will disconnect from the line if data is not sent or received for a specified length of time. In normal or error-correction mode, this inactivity timer is reset when data is received from either the DTE or from the line. This timer can be set to a value between 0 and 2550 seconds by register S30. A value of 0 disables the inactivity timer.

DTE Signal Monitoring

DTR. When DTR is asserted, the modern responds in accordance with the &Dn and &Qn commands.

RTS. RTS is used for flow control if enabled by the &K command in normal or error-correction mode, or to affect

the CTS output if enabled by the &R command in synchronous mode.

RDL. When RDL is asserted, the modern requests a remote digital loop if connected in non-error-correction mode (serial interface only).

AL. When AL is asserted, the modern disconnects and enters analog loop (serial interface only).

ERROR CORRECTION AND DATA COMPRESSION

V.42 Error Correction

V.42 supports two methods of error correction: LAPM and, as a alternative, MNP 4. The modem provides a detection and negotiation technique for determining and establishing the preferred method of error correction between two modems.

MNP 2-4 Error Correction

MNP 2-4 is a data link protocol that uses error correction algorithms to ensure data integrity. MNP block or stream mode operation may be selected by the \Ln command.

In stream mode, the modem sends data frames in varying lengths depending on the amount of time between characters coming from the DTE.

In block mode, the modem sends data frames of 256 characters in length. Special communication software must be used when using block mode.

V.42 bis Data Compression

V.42 bis data compression mode, enabled by the %Cn or S46 command, operates when a LAPM or MNP 10 connection is established.

The V.42 bis data compression employs a "string learning" algorithm in which a string of characters from the DTE is encoded as a fixed length codeword. Two 2k-byte dictionaries are used to store the strings. These dictionaries are dynamically updated during normal operation.

MNP 5 Data Compression

MNP 5 data compression mode, enabled by the %Cn command, operates during an MNP connection.

In MNP 5, the modem increases its throughput by compressing data into tokens before transmitting it to the remote modem, and by decompressing encoded received data before sending it to the DTE.

MNP 10 DATA THROUGHPUT ENHANCEMENT (TO V.32 BIS)

MNP10 protocol, cellular functionality, and MNP Extended Services enhance performance under adverse channel conditions such as those found in rural, long distance, or cellular environments. An MNP 10 connection is established when either an MNP 2-4 connection is negotiated with a remote modem supporting MNP 10 or MNP 10 extended services is enabled as described below. MNP 10 functions include:

Robust Auto-Reliability. Higher connection success rate is achieved by attempting to overcome channel interference during the modern negotiation phase while maintaining backward compatibility with non-MNP 10 moderns.

Negotiated Speed Upshift. Initial connection and MNP handshake is performed at the most dependable speed, then the connection upshifts to the highest supported modem/channel speed. This function is particularly useful in channel conditions with high connection failure rates.

Aggressive Adaptive Packet Assembly. Frame size is dynamically changed to quickly adapt to varying levels of interference.

Dynamic Speed Shifting. Connection speed is shifted upward or downward to optimize data throughput for the channel conditions by continuously monitoring the line quality and link performance.

Dynamic Transmit Level Adjustment. Transmit level is dynamically adjusted to adapt to the varying cellular network environment and to prevent "clipping," which causes data corruption, due to the Preemphasis and Compander effect

MNP Extended Services. The modem can quickly switch to MNP 10 operation when the remote modem supports MNP 10 and both modems are configured to operate in V42.

V.42 bis/MNP 5 Support. MNP 10 can operate with V.42 bis or MNP 5 data compression.

FAX CLASS 1 AND CLASS 2 OPERATION

The modem operates as a facsimile (fax) DCE whenever the +FCLASS=1 or +FCLASS=2 command is active. In the fax mode, the on-line behavior of the modem is different from the data (non-fax) mode. After dialing, modem operation is controlled by the fax commands. Some AT commands are still valid but may operate differently from data modem mode.

Calling Tone

Calling tone is generated in accordance with T.30.

WORLD CLASS COUNTRY SUPPORT

The W-class models include functions which support modem operation in multiple countries. The following capabilities are provided in addition to the data modem functions previously described. Country dependent parameters are all programmable by ConfigurACE.

V.25 bis Commands

V.25 bis commands (Table 2) are available in asynchronous modes when enabled by the AT/V25B bit in the External Buffer 1 inputs.

Blacklist Parameters

The modem can operate in accordance with requirements of individual countries to prevent misuse of the network by limiting repeated calls to the same number when previous call attempts have failed. Call failure can be detected for

MD98C1

reasons such as no dial tone, number busy, no answer, no ringback detected, voice (rather than modem) detected, and key abort (dial attempt aborted by user). Actions resulting from such failures can include specification of minimum inter-call delay, extended delay between calls, and maximum numbers of retries before the number is permanently forbidden ("blacklisted"). Up to 40 such numbers may be tabulated. The blacklist parameters are established by ConfigurACE.

Dialing

Dial Tone Detection. Dial tone detection levels and frequency ranges are programmable by ConfigurACE.

DTMF Dialing. Transmit output level, DTMF signal duration, and DTMF interdigit interval parameters are programmable by ConfigurACE.

Pulse Dialing. Parameters such as make/break times, set/clear times, and dial codes are programmable by ConfigurACE.

Ring Detection. The frequency range is programmable by ConfigurACE.

Adaptive Dialing. Adaptive dialing can be disabled by ConfigurACE.

Blind Dialing. Blind dialing, permitted only in some countries, can be enabled or disabled by setting or resetting a flag bit in the corresponding country file using ConfigurACE. If enabled, blind dialing can be invoked using the ATX command; if disabled, blind dialing is not available.

Carrier Transmit Level

The carrier transmit level is programmable by ConfigurACE to match specific country and DAA characteristics.

Calling Tone

Calling tone is generated in accordance with V.25. Calling tone may be toggled (enabled/disabled) by inclusion of a "^" character in a dial string. It may also be enabled or disabled by programming a country specific parameter using ConfigurACE.

Call Progress Tone Detection

Frequency and cadence of tones for busy, ringback, congested, dial tone 1, and dial tone 2 are programmable by ConfigurACE.

Answer Tone Detection

The answer tone detection period is programmable by ConfigurACE.

Relay Control

On-hook/off-hook, make/break, and set/clear relay control parameters are programmable by ConfigurACE.

Automatic Country Code Recognition

Automatic country code recognition is supported in conjunction with country identification code circuitry provided

in the DAA. Automatic country code recognition is enabled using the AT*NCnn command with nn = 0. Automatic country code recognition is disabled using the AT*NCnn command with nn = any valid country code other than 0. (See the IDID and IDCLK parameters in Table 9.)

Once enabled, the MCU interrogates the DAA circuit upon reset (POR or the ATZ command) or attempt to go off-hook. An 8-bit country code is shifted in from the DAA and is used to look up the corresponding country code parameters loaded in ROM. If country code parameters are present for the shifted-in country code and the country is different from the active country, the country code parameters are loaded. If the shifted-in country code does match a country with stored parameters in ROM, the modem issues an ERROR message.

Note that when automatic country code recognition is enabled, the country code can be changed at any time before going off-hook (e.g., by changing the DAA or selecting a different country code on the DAA). Upon going off-hook, the MCU will then load the country code parameters corresponding to the new DAA country code.

ConfigurACE UTILITY PROGRAM

The ConfigurACE utility program allows the OEM to customize the MCU firmware to suit specific application and country requirements. ConfigurACE allows programming of functions such as:

- -Loading of multiple sets of country parameters
- -Call progress and blacklisting parameters
- -Entry of S register maximum/minimum values
- -Use of "soft switches" instead of panel switches
- -Modification/limitation of transmit levels
- -Modification of result codes
- -Modification of factory default values
- -Customization of the ATI4 response
- -Customization of fax OEM messages

This program, which runs on a PC-compatible computer, modifies the hex object code which can be programmed directly into the system ROM. Lists of the generated parameters can be displayed or printed.

Rockwell-provided country parameter files allow a complete set of country-specific call progress and blacklisting parameters to be selected.

DIAGNOSTICS

Commanded Tests

Diagnostics are performed in response to &T commands, serial interface control signals, or switch inputs per V.54.

Analog Loopback. Data from the local DTE is sent to the modem, which loops the data back to the local DTE.

Analog Loop Self Test. An internally generated test pattern of alternating 1s and 0s (reversals) is sent to the modem. An error detector within the modem checks for errors in the string of reversals.

Remote Digital Loopback (RDL). Data from the local DTE is sent to the remote modern which loops the data back to the local DTE.

Remote Digital Loopback with Self Test. An internally generated pattern is sent from the local modem to the remote modem which loops the data back to the local modem.

Local Digital Loopback. When local digital loop is requested from the local DTE, two data paths are set up in the local modem. Data from the local DTE is looped back to the local DTE (path 1) and data received from the remote modem is looped back to the remote modem (path 2).

Power On Reset Tests

Upon power on, or receipt of the Z command, the modem performs tests of the MDP, RAM, ROM, and NVRAM.

LOW POWER MODES

Sleep Mode

Entry. The modem will enter the low power sleep mode when no line connection exists and no host activity occurs for the period of time specified in the S24 register. All MCU circuits are turned off except the internal MCU clock circuitry in order to consume lower power but be able to immediately wake up and resume normal operation.

Wake-Up. Wakeup occurs when a ring is detected on the telephone line, the host writes to the modem (parallel interface version) or the DTE sends a character to the modem (serial interface version).

Stop Mode

Entry. The modem will enter the low power stop mode when the STPMODE input is asserted. All MCU circuits are turned off including the internal MCU clock circuitry in order to consume lower power than sleep mode. The modem will enter stop mode immediately, terminating a line connection, terminating any test in process, and allowing any data in the Receive Buffer Register to clear.

STPMODE must be returned high before the modern can wake-up.

Wake-Up. Wakeup occurs when a ring is detected on the telephone line, the host writes to the modem (parallel interface version) or the DTE sends a character to the modem (serial interface version). Since the modem requires more time to attain normal operation when waking up from Stop mode rather than from Sleep mode, the host must send a character to the modem before issuing the first AT command.

12

CALLER ID

Caller ID can be enabled/disabled using the #CID command. When enabled, caller ID information (date, time, caller code, and name) can be passed to the DTE in formatted or unformatted form. Inquiry support allows the current caller ID mode and mode capabilities of the modem to be retrieved from the modem.

ADDITIONAL INFORMATION

Additional information is described in the RC288ACi/VFC, RC240ACi/VFC, and RC192ACi/VFC Modem Designer's Guide (Order No. 899) and the AT Command Reference Manual (Order No. 1034).

HARDWARE INTERFACE

HARDWARE INTERFACE SIGNALS

The modern hardware interface signals for serial and parallel interface configurations are shown in Figures 2 and 3, respectively.

The MCU pin assignments for serial interface firmware are shown in Figure 4 and are listed in Table 5.

The MCU pin assignments for parallel interface firmware are shown in Figure 5 and are listed in Table 6.

The CEP pin assignments are shown in Figure 6 and are listed in Table 7.

The MDP pin assignments are shown in Figure 7 and are listed in Table 8.

The MCU hardware interface signals are defined in

The MDP hardware interface signals are defined in Table 10.

The CEP hardware interface signals are defined in Table 11.

The digital electrical characteristics for the hardware interface signals are listed in Table 12.

The analog electrical characteristics for the hardware interface signals are listed in Table 13.

The current and power requirements are listed in Table 14.

The absolute maximum ratings are listed in Table 15.

Table 16 shows the parallel interface registers and the corresponding bit assignments.

Table 9. MCU Signal Definitions

Label	I/O Type	Signal Name/Description
XTLI, XTLO	IE, OE	MCU SYSTEM MCU Crystal/Clock In and Crystal Out. Connect to an external crystal circuit consisting of a 12.9024 MHz crystal (high performance configuration, i.e., with CEP) or 14.7456 MHz crystal (low cost configuration, i.e., without CEP), and a capacitance network.
RES	IC	MCU Reset. The active low RES input resets the MCU logic, and restores the saved configuration from NVRAM, or returns the modem to the factory default values if NVRAM is not present. For serial interface, the RES input is typically connected to MDP POR pin and a reset circuit. For parallel interface, the RES input is connected to the MDP POR pin and the host bus RESET line through an inverter.
DPIRQ	IA	MDP Interrupt Request. Connect to the MDP IRQ output.
DPRXD	IA	MDP Received Data. Connect to the MDP MRXD output.
VCC1, VCC2	PWR	+ 5V Digital Supply. +5V ± 5%.
GND1-GND8	GND	Digital Ground. Connect to ground.
		LINE INTERFACE
RLY1	OA	Relay 1 Control (OH). The active low RLY1 output can be used to control the normally open off-hook relay.
RLY2	OA	Relay 2 Control (PULSE). The active low RLY2 output can be used to control the normally open pulse dial relay.
RLY3	OA	Relay 3 Control (MUTE, A/A1). The active low RLY3 output can be used to control the normally open mute relay or the normally open key telephone hold indicator (A/A1) relay.
RLY4	OA	Relay 4 Control (EARTH, T/DRLY). The active low RLY4 output can be used to control the normally open earthing relay or the normally closed talk/data relay.
LCS	IA	Line Current Sense. LCS is an active high input that indicates an handset off-hook status.
RINGD	IA	Ring Frequency. A high-going edge on the RINGD input initiates an internal ring frequency measurement. The RINGD input from an external ring detect circuit is monitored to determine when to wake up from sleep or stop mode. The RINGD input is typically connected to the output of an optoisolator or equivalent. The idle state (no ringing) output of the ring detect circuit should be low
IDCLK	OA	Country Identifier Clock. IDCLK is an output clock to the country identifier shift register.
IDID	IA	Country Identifier Code. IDID is an input serial stream from the country identifier shift register.
		NVRAM INTERFACE
NVMCLK	OA	NVRAM Clock. NVMCLK output high enables the NVRAM.
NVMDATA	IA/OA	NVRAM Data. The NVMDATA pin supplies a serial data interface to the NVRAM.
		EXTERNAL MEMORY BUS INTERFACE
A0-A15	OA	Address Lines 0-15. A0-A15 are the external memory bus address lines.
A16	OA	Address Line 16. A16 is a bank select line.
D0-D7	IA/OA	Data Line 0-7. D0-D7 are the external memory bus data lines.
READ	OA	Read Enable. READ output low enables data transfer from the selected device to the D0-D7 lines
WRITE	OA	Write Enable. WRITE output low enables data transfer from the D0-D7 lines to the selected device
DPSEL	OA	Modem Data Pump Select. DPSEL output low selects the MDP.
RAMSEL	OA	RAM Select. RAMSEL output low selects the external RAM.
ROMSEL	OA	ROM Select. ROMSEL output low selects the external 64k/128k-byte ROM.
CEPSEL	OA	CEP Select. CEPSEL output low selects the CEP.
INXSEL	OA	Input Buffer Select. INXSEL output low and A0 high select external input buffer 1. INXSEL output low and a low from A0 NANDed with WRITE select external input buffer 2. INXSEL output low clocked by WRITE select the external latch. (Serial interface only.)

Table 9. MCU Signal Definitions (Cont'd)

	I/O Type	Signal Name/Description	
		V.24 (EIA-232-D) SERIAL INTERFACE (SERIAL INTERFACE ONLY)	
		The serial interface signals correspond functionally to V.24/EIA-232-D signals. The signals levels are TTL compatible and are inverted from V.24/EIA-232-D levels.	
TXD	IA	Transmitted Data (EIA BA/CCITT CT103). The DTE uses the $\overline{\text{TXD}}$ line to send data to the modem for transmission over the telephone line or to transmit commands to the modem.	
RXD	OA	Received Data (EIA BB/CCITT CT 104). The modern uses the RXD line to send data received from the telephone line to the DTE and to send modern responses to the DTE. During command mode, RXD data represents the modern responses to the DTE.	
стѕ	OA	Clear To Send (EIA CB/CCITT CT106). CTS output ON (low) indicates that the DTE is ready to accept data from the DTE. In asynchronous operation, in error correction or normal mode, CTS is always ON (low) unless RTS/CTS flow control is selected by the &Kn command.	
		In synchronous operation, the modem also holds CTS ON during asynchronous command state. The modem turns CTS OFF immediately upon going off-hook and holds CTS OFF until both DSR and RLSD are ON and the modem is ready to transmit and receive synchronous data. The modem can also be commanded by the &Rn command to turn CTS ON in response to an RTS OFF-to-ON transition.	
DSR	OA	Data Set Ready (EIA CC/CCITT CT107). DSR indicates modern status to the DTE. DSR OFF (high) indicates that the DTE is to disregard all signals appearing on the interchange circuits except Ring Indicator (RI). DSR output is controlled by the AT&Sn command.	
RLSD	OA	Received Line Signal Detector (EIA CF/CCITT CT109). When AT&C0 command is not in effect, RLSD output is ON when a carrier is detected on the telephone line or OFF when carrier is not detected.	
TM	OA	Test Mode Indicate (EIA TM/CCITT CT142). The TM output indicates the modem is in test mode (low) or in any other mode (high).	
RI	OA	Ring indicator (EIA CE/CCITT CT125). RI output ON (low) indicates the presence of an ON segment of a ring signal on the telephone line.	
DRSOUT	OA	Data Signalling Rate Indicator (EIA CI/CCITT CT112). DRSOUT is ON (low) when the modern desires or is engaged in the high speed (2400 bps or higher) mode. DRSOUT is OFF (high) otherwise.	
DTR	IA	Data Terminal Ready (EIA CD/CCITT CT108). The DTR input is turned ON (low) by the DTE where the DTE is ready to transmit or receive data. DTR ON prepares the modern to be connected to the telephone line, and maintains the connection established by the DTE (manual answering) or internally (automatic answering). DTR OFF places the modern in the disconnect state under control of the &Dn and &Qn commands.	
RTS	IA	Request To Send (EIA CA/CCITT CT105). RTS input ON (low) indicates that the the DTE is ready to accept data from the modern. In the command state, the modern ignors RTS.	
		In asynchronous operation, the modem ignors RTS unless RTS/CTS flow control is selected by the &Kn command.	
		In synchronous on-line operation, the modem can be commanded by the &Rn command to ignor RTS or to respond to RTS by turning on CTS after the delay specified by Register S26.	
RDL	IA	Remote Digital Loop Select (EIA RL/CCITT CT140). RDL input low activates remote digital loop request. The loop is executed at the speed for which the modern is currently configured.	
ĀL	IA	Analog Loop (EIA LL/CCITT CT141). The AL input low causes the modem to assume the analog loop test mode.	
DRSIN	IA	Data Signalling Rate Select (EIA CI/CCITT CT111). This signal, relevant only in Central Europe, applies only to V.22 bis and V.22 modes. DRSIN ON (low) will result in a 2400 bps connection. DRSIN OFF (high) will force a 1200 bps connection, or will result in a fallback from 2400 bps to 1200 bps if already on-line.	

Table 9. MCU Signal Definitions (Cont'd)

I/O Type	Signal Name/Description	
OA	LED INDICATOR CIRCUIT INTERFACE (SERIAL INTERFACE ONLY) Auto Answer Indicator. AAIND output ON (low) corresponds to the indicator on. AAIND output is active when modem will answer the ring automatically (ATS0 command = 0).	
OA	Test Mode Indicator. TMIND output ON (low) corresponds to the indicator on. TMIND output pulses (LED flashes) when modem is in test mode and if an error is detected.	
OA	DTR Indicator. DTRIND output ON (low) corresponds to the indicator on. The DTRIND state reflects the DTR output state except when the &D0 command is active, in which case DTRIND is low.	
	AUXILIARY CIRCUITS (SERIAL INTERFACE ONLY)	
OA	Clock Stop. Active low output that can be used to force the RXCLK and TXCLK outputs high to the DTE.	
	RESET SAMPLED DIRECT SWITCH INPUT TO MCU	
	This switch input can be read upon power up or after a warm reset.	
IA	PTT Test Enable. The PTTEN input enables (high) or disables (low) the use of the PTT test commands. PTTEN is checked only for countries which do not permit the use of the %TT command at the approval site (e.g., Germany).	
	EXTERNAL BUFFER 1 INPUTS TO MCU (SERIAL INTERFACE ONLY)	
	Switch inputs are available via external buffer 1 as enabled by ConfigurACE. These inputs are sampled onto the data bus, typically via a 74HCT541 three-state buffer (see INXSEL). The data bus bit number for each signal is defined below.	
Bus	Switch Enable. The SWTCHEN input (bit 0) enables (high) or disables (low) use of external switch inputs to invoke AT commands and S Register functions rather than default values from ROM.	
Bus	Clock Select 1 and 2. The CLKSEL1 and CLKSEL2 inputs (bits 1 and 2, respectively) select async/sync operation and the clock source for synchronous operation. The selectable options are:	
Bus	Mode/Clock Source Asynchronous Synchronous with Internal clock Synchronous with External clock Synchronous with Slave clock H DSR/DTR Override. The DSRDTROV input (bit 3) enables (high) or disables (low) override of DSR	
	and DTR from the EIA (V.24) interface.	
Bus	AT/V.25 bls Commands Select. The AT/V25B input (bit 5) selects V.25 bis (high) or AT command (low) operation.	
	OA OA Bus Bus

Table 9. MCU Signal Definitions (Cont'd)

Label	I/O Type	Signal Name/Description
TSTIND	Bus	Test Indicate. When SELIND is OFF, the TSTIND output (bit 1) is ON during modern test (see TEST input). When SELIND is ON, the TSTIND output reflects the state of bit 0 of the directory entry selection (see SELIND output).
OAIND	Bus	Originate/Answer Indicate. When SELIND is OFF, OAIND output (bit 2) reflect the originate (OFF) or answer (ON) state when connected or toggles to originate (OFF) or answer (ON) in response to the OA input ON-to-OFF transition. When SELIND is ON, the OAIND output reflects the state of bit 1 of the directory entry selection (see SELIND output).
COMIND	Bus	Compressed Indicate. COM:ND output (bit 4) indicates data compression (MNP 5, V.42 bis) is in effect (high) or is not in effect (low).
RELIND	Bus	Reliable Connection Indicate. RELIND output (bit 5) indicates that a reliable connection (MNP, LAPM) is in effect (high) or a non-error-connected connection exists or the modern is off-line (low).
· **		PARALLEL HOST INTERFACE (PARALLEL INTERFACE ONLY)
		The parallel interface emulates a 16450/16550A UART interface. The parallel interface is compatible with communications software designed to operate with a 16450/16550A interface.
HA0-HA2	IA	Host Bus Address Lines 0-2. During a host read or write operation, HA0-HA2 select an internal MCU 16450/16550A-compatible register.
HD0-HD7	IA/OA	Host Bus Data Lines 0-7. HD0-HD7 are comprised of eight three-state input/output lines providing bidirectional communication between the host and the MCU. Data, control words, and status information are transferred through HD0-HD7.
HCS	IA	Host Bus Chip Select. HCS input low selects the host bus.
HRD	IA	Host Bus Read. HRD is an active low, read control input. When HCS is low, HRD low allows the host to read status information or data from a selected MCU register.
HWT	IA	Host Bus Write. HWT is an active low, write control input. When HCS is low, HWT low allows the host to write data or control words into a selected MCU register.
HINT	OA	Host Bus Interrupt. HINT output is set high when the receiver error flag, received data available, transmitter holding register empty, or modern status interrupt has an active high condition. HINT is reset low upon the appropriate interrupt service or master reset operation.
TXACK	IA	Host Transmit Acknowledge. TXACK is an active low transmit acknowledge input acknowledging that the DMA controller received the Transmit Ready (TXRDY) data transfer request output.
RXACK	IA	Host Receive Acknowledge. RXACK is an active low receive acknowledge input acknowledging that the DMA controller received the Receiver Ready (RXRDY) data transfer request output.
TXRDY	OA	Transmitter Ready. TXRDY is an active high transmit ready output in the FIFO mode (FCR0 = 1). When asserted, TXRDY indicates that the TX FIFO is not full, i.e., the TX FIFO can accept data to be transmitted.
RXRDY	OA	Receiver Ready. RXRDY is an active high receiver ready output in the FIFO mode (FCR0 = 1). When asserted, RXRDY indicates that the RX FIFO is not empty, i.e., the RX FIFO has received data ready for transfer.
	······································	STOP MODE CONTROL
STPMODE	IA	Stop Mode. STPMODE low causes the modem to enter the stop mode immediately after terminating a line connection if connected, terminating any test in process, and allowing any data in the receive buffer to clear. STPMODE must be high before the modem can attain normal operation after power turn-on, reset, or wake-up from sleep or stop mode.

Table 10. MDP Signal Definitions

Label	I/O Type	Signal/Definition
		OVERHEAD SIGNALS
XTLI, XTLO	I, O	Crystal In and Crystal Out. Connect to an external crystal circuit consisting of a 40.32 MHz crystal, three capacitors, and an inductor, or to a square wave generator/sine wave oscillator.
POR	IA	Power On Reset. Connect to MCU RES.
RESET	IA	Reset. Connect to MDP POR.
+5VD	PWR	+ 5V Digital Supply. +5V ± 5%.
+5VA	PWR	+ 5V Analog Supply. +5V ± 5%.
DGND	GND	Digital Ground. Connect to ground.
AGND	GND	Analog Ground. Connect to ground.
vc	MI	Low Voltage Reference. Connect to analog ground through 10 μ F (polarized, + terminal to VC) and 0.1 μ F (ceramic) in parallel.
VREF	MI	High Voltage Reference. Connect to VC through 10 μF (polarized, + terminal to VREF) and 0.1 μF (ceramic) in parallel.
VREG	MI	Voltage Regulator. No connect. For compatibility with future modern data pumps, provide a printed circuit board connection to digital ground through 0.1 μ F. This capacitor may be installed for this modern but is not required.
		SERIAL INTERFACE (SERIAL INTERFACE ONLY)
TXD	IA	Transmitted Data. The MDP obtains serial data to be transmitted from the DTE on the TXD input.
RXD	OA	Received Data. The MDP presents received serial data to the DTE on the RXD output.
TDCLK	OA	Transmit Data Clock. The modem outputs a synchronous Transmit Data Clock (TDCLK) for USRT timing. The TDCLK frequency is the data rate (±0.01%) with a duty cycle of 50 ±1%.
XTCLK	IA	External Transmit Clock. In synchronous communication, an external transmit data clock can be connected to the MDP XTCLK input. The clock supplied at XTCLK must exhibit the same characteristics as TDCLK.
RDCLK	OA	Receive Data Clock. The modem outputs a synchronous Receive Data Clock (RDCLK) for USRT timing.
RTS	IA	Request to Send. Not used; pull up to VCC through 10k Ω .
DTR	IA	Data Terminal Ready. Not used; pull up to VCC through 10k Ω .
CTS	OA	Clear to Send. Not used; leave open.
DSR	OA	Data Set Ready. Not used; leave open.
		INDICATOR SIGNALS (SERIAL INTERFACE ONLY)
RLSDIND	OA	Received Line Signal Detector. RLSDIND active indicates that energy above the receive level threshold is present on the receiver input, and that the energy is not a training sequence.
		SERIAL/INDICATOR INTERFACE (PARALLEL INTERFACE ONLY)
TXD	IA	Transmitted Data. Not used; pull up to VCC through 10k Ω .
RXD	OA	Received Data. Not used; leave open.
TDCLK	OA	Transmit Data Clock. Not used; leave open.
XTCLK	IA	External Transmit Clock. Not used; leave open.
RDCLK	OA	Receive Data Clock. Not used; leave open.
RLSDIND	OA	Received Line Signal Detector. Not used, leave open.
RTS	IA	Request to Send. Not used; pull up to VCC through 10k Ω .
DTR	IA	Data Terminal Ready. Not used; pull up to VCC through 10k Ω .
CTS	OA	Clear to Send. Not used; leave open.
DSR	OA	Data Set Ready. Not used; leave open.

Table 10. MDP Signal Definitions (Cont'd)

Label	I/O Type	Signal/Definition
		MCU INTERFACE
D0-D7	IA /OB	Data Lines. Connect to the MCU D0-D7, respectively.
RS0-RS4	IA	Register Select Lines. Connect to the MCU A0-A4, respectively.
cs	IA	Chip Select. Connect to MCU DPSEL output.
READ	IA	Read Enable. Connect to MCU READ.
WRITE	IA	Write Enable. Connect to MCU WRITE.
IRQ	OA	Interrupt Request. Connect to MCU DPIRQ.
		LINE INTERFACE
TXA1, TXA2	O(DF)	Transmit Analog 1 and 2. The TXA1 and TXA2 outputs are differential outputs 180 degrees out of phase with each other.
RIN	I(DA)	Receive Analog. RIN is a single-ended receive data input from the external hybrid in the telephone line interface circuit.
RINGD	IA	Ring Frequency Detect. A high-going edge on the RINGD input initiates an internal ring frequency measurement. The RINGD input is typically connected to the output of an optoisolator or equivalent. The idle state (no ringing) output of the ring detect circuit should be low.
CALLID	OD	Caller ID Relay Control (MDP OHRC). Typically, the MDP CALLID output is connected to the normally open Caller ID relay. When the modern detects a Calling Number Delivery (CND) message, the CALLID output is asserted to close the CALLID relay in order to AC couple the CND information to the modern RIN input (without closing the off-hook relay and allowing loop current flow which would indicate an off-hook condition).
		The MDP CALLID output can each directly drive a +5V reed relay coil with a minimum resistance of 360 ohms and having a must-operate voltage of no greater than 4.0 Vdc. A clamp diode, such as a 1N4148, should be installed across the relay coil. An external transistor, such as an MPSA20, can be used to drive heavier loads (e.g., electro-mechanical relays).
		SPEAKER INTERFACE
SPKR	O(DF)	Speaker Analog Output. The SPKR output reflects the received analog input signal. The SPKR is controlled by the ATMn command. The SPKR output can drive an impedance as low as 300 ohms. In a typical application, the SPKR output is an input to an external LM386 audio power amplifier. DIAGNOSTIC SIGNALS
		Three signals provide the timing and data necessary to create an oscilloscope quadrature eye pattern. The eye pattern is simply a display of the received baseband constellation. By observing this constellation, common line disturbances can usually be identified.
EYEXY	OA	Serial Eye Pattern X/Y Output. EYEXY is a serial output containing two 15-bit diagnostic words (EYEX and EYEY) for display on the oscilloscope X axis (EYEX) and Y axis (EYEY). EYEX is the first word clocked out; EYEY follows. Each word has 8-bits of significance. Each 15-bit data word is shifted out most significant bit first with the seven most significant bits set to zero. EYEXY is clocked by the rising edge of EYECLK. This serial digital data must be converted to parallel digital form by a serial-to-parallel converter and then to analog form by two digital-to-analog (D/A) converters.
EYECLK	OA	Serial Eye Pattern Clock. EYECLK is a 288 kHz output clock for use by the serial-to-parallel converters. The low-to-high transitions of EYECLK. EYECLK, therefore, can be used as a receiver multiplexer clock.
EYESYNC	OA	Serial Eye Pattern Strobe. EYESYNC is a strobe for loading the D/A converters.

Table 11. CEP Signal Definitions

Label	I/O Type	Signal Name/Description
		CEP SYSTEM
XTLI, XTLO	IE, OE	CEP Crystal/Clock in and Crystal Out. Connects to an external crystal circuit consisting of a 12.9024 MHz crystal and a capacitance network. The CEP XTLI input can be connected to the MCU XTLO output.
RES	IC	CEP Reset. The active low RES input resets the CEP logic For serial Interface, the RES input typically connected to MDP POR, a reset switch, and/or the DTR input as enabled by the HRESETEN output. For parallel Interface, the RES input is typically connected to the host bus RESET line through an inverter.
VCC1, VCC2	PWR	+ 5V Digital Supply. +5V \pm 5%.
GND1-GND8	GND	Digital Ground. Connect to ground.
		CEP MEMORY BUS (CMB) BUS INTERFACE
SD0-SD7	IA/OB	Data Lines. Connect the RAM D0-D7 lines to the to the SD0-SD7 lines, respectively.
SA0-SA14	OA	Address Lines. Connect the RAM A0-A14 lines to the to the SA0-SA14 lines, respectively.
SRAMSEL	OA	RAM Chip Select. Connect the RAM CS input to the SRAMSEL line.
SROMSEL	OA	ROM Chip Select. Connect the ROM CS input to the SROMSEL line.
SRD	OA	Read Enable. Connect the RAM RD input to the SRD line.
SWT	OA	Write Enable. Connect the RAM WT input to the SWT line.
		MCU EXTERNAL BUS INTERFACE
MCU: D0-D7	IA/OB	MCU Bus Data Lines. Connect to the MCU D0-D7, respectively.
MCU: A0-A3	IA	MCU Bus Address Lines. Connect to the MCU A0-A3, respectively.
MCU: CEPSEL	IA	MCU Bus CEP Chip Select. Connect to MCU CEPSEL output.
MCU: RD	IA	MCU Bus Read Enable. Connect to MCU READ.
MCU: WT	IA	MCU Bus Write Enable, Connect to MCU WRITE.

Table 12. Digital Interface Characteristics

Parameter	Symbol	Min.	Тур.	Max.	Units	Test Conditions ¹
Input High Voltage Type IA Type IC Type IE	ViH	2.0 0.7 V _{CC}	- - 4.0	Vcc + 0.3	Vdc	Note 2.

Input Leakage Current RES and PD0-PD7 XTLI NMI and TST	lin	- - -	- - -	±2.5 ±10 ±100	μAdc	ViN = 0 to Vcc
Output High Voltage Type OA and OB Type OD Type OE	Vон	2.4 -	=	_ V∞	Vđc	ILOAD = - 100 μA ILOAD = 0 mA Note 3.
Output Low Voltage Type OA Type OB Type OD	VoL	-	- - -	0.4 0.4 0.75	Vdc	ILOAD = 1.6 mA ILOAD = 0.8 mA ILOAD = 15 mA
Three-State (Off) Current	İTSI			±10	μAdc	Vin = 0 V to Vcc

Notes:

1. Test Conditions: $V_{CC} = 5V \pm 5\%$, $T_A = 0^{\circ}C$ to $70^{\circ}C$, (unless otherwise stated).

Output loads: Data bus (D0-D7), address bus (A0-A15), chip selects, READ, and WRITE loads = 70 pF + one TTL load.

Other = 50 pF + one TTL load.

2. Type IE inputs are centered approximately 2.5 V and swing 1.5 VPEAK in each direction.

3. Type OE outputs provide oscillator feedback when operating with an external crystal.

Table 13. Analog Characteristics

Name	Type	Characteristic	Value
RIN	I (DA)	input Impedance	> 70K Ω
		Maximum AC Input Voltage	1.1 VP-P**
		Reference Voltage*	+2.5 VDC

DC Output Clamp Current	lok	±20	mA	
Static Discharge Voltage (@ 25°C)	VESD	±2500	V	
Latch-Up Current (@ 25°C)	ITRIG	±200	mA	
Operating Temperature Range	TA		1	
Commercial		-0 to +70	•c	
Extended		-40 to +85	•c	
Storage Temperature Range	TSTG	-55 to +125	•c	

^{1.} Maximum power @ -40°C specified only for extended temperature range parts.

^{2.} Test conditions: VCC = 5.0 VDC for typical values; VCC = 5.25 VDC for maximum values.

Table 16. Parallel Interface Registers

Register No.		Bit No.									
	Register Name	7	6	5	4	3	2	1	0		
7	Scratch Register (SCR)	Scratch Register									
6	Modem Status Register (MSR)	Data Carrier Detect (DCD)	Ring Indicator (RI)	Data Set Ready (DSR)	Clear to Send (CTS)	Deita Data Carrier Detect (DDCD)	Trailing Edge of Ring Indicator (TERI)	Delta Data Set Ready (DDSR)	Delta Clear to Send (DCTS)		
5	Line Status Register (LSR)	RX FIFO Error	Transmitter Empty (TEMT)	Transmitter Buffer Register Empty (THRE)	Break Interrupt (BI)	Framing Error (FE)	Parity Error (PE)	Overrun Error (OE)	Receiver Data Ready (DR)		
4	Modern Control Register (MCR)	0	0	0	Local Loopback	Out 2	Out 1	Request to Send (RTS)	Data Terminal Ready (DTR)		
3	Line Control Register (LCR)	Divisor Latch Access Bit (DLAB)	Set Break	Stick Parity	Even Parity Select (EPS)	Parity Enable (PEN)	Number of Stop Bits (STB)	Word Length Select Bit 1 (WLS1)	Word Length Select Bit 0 (WLS0)		
2	Interrupt Identify Register (IIR) (Read Only)	FIFOs Enabled	FIFOs Enabled	0	0	Pending Interrupt ID Bit 2	Pending Interrupt ID Bit 1	Pending Interrupt ID Bit 0	"0" if Interrupt Pending		
2	FIFO Control Register (FCR) (Write Only)	Receiver Trigger MSB	Receiver Trigger LSB	Reserved	Reserved	DMA Mode Select	TX FIFO Reset	RX FIFO Reset	FIFO Enable		
1 DLAB = 0	Interrupt Enable Register (IER)	0	0	0	0	Enable Modem Status Interrupt (EDSSI)	Enable Receiver Line Status Interrupt (ELSI)	Enable Transmitter Holding Register Empty Interrupt (ETBEI)	Enable Received Data Available Interrupt (ERBFI)		
0 DLAB = 0	Transmitter Buffer Register (THR)	Transmitter FIFO Buffer Register (Write Only)									
0 DLAB = 0	Receiver Buffer Register (RBR)	Receiver FIFO Buffer Register (Read Only)									
1 DLAB = 1	Divisor Latch MSB Register (DLM)	Divisor Latch MSB									
0 DLAB = 1	Divisor Latch LSB Register (DLL)	Divisor Latch LSB
