CMOS SRAM

AS7C164
AS7C164L

8K×8 CMOS SRAM (Common I/O)

SRAM

Features

- Organization: 8,192 words × 8 bits
- High speed
  - 8/10/12/15/20 ns address access time
  - 3/3/3/4/5 ns output enable access time
- Low power consumption
  - Active: 633 mW max (10 ns cycle)
  - Standby: 11 mW max, CMOS I/O
    1.1 mW max, CMOS I/O, L version
- Very low DC component in active power

- 2.0V data retention (L version)
- Equal access and cycle times
- Very fast 3 ns output enable access time
- Easy memory expansion with $\overline{CE1}$, CE2, $\overline{OE}$ inputs
- TTL-compatible, three-state I/O
- 28-pin JEDEC standard packages
- 300 mil PDIP and SOJ
- ESD protection ≥ 2000 volts
- Latch-up current ≥ 200 mA

Functional description

The AS7C164 is a high performance CMOS 65,536-bit Static Random Access Memory (SRAM) organized as 8,192 words × 8 bits. It is designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times (t_{AA}, t_{RC}, t_{WC}) of 8/10/12/15/20 ns with output enable access times (t_{OE}) of 3/3/3/4/5 ns are ideal for high performance applications. Active high and low chip enables ($\overline{CE1}$, CE2) permit easy memory expansion with multiple-bank memory systems.

When $\overline{CE1}$ is High or CE2 is Low the device enters standby mode. The standard AS7C164 is guaranteed not to exceed 11.0 mW power consumption in standby mode; the L version is guaranteed not to exceed 1.1 mW, and typically requires only 250 µW. The L version also offers 2.0V data retention, with maximum power of 120 µW.

A write cycle is accomplished by asserting write enable ($\overline{WE}$) and both chip enables ($\overline{CE1}$, CE2). Data on the input pins I/O0-I/O7 is written on the rising edge of $\overline{WE}$ (write cycle 1) or the active-to-inactive edge of $\overline{CE1}$ or CE2 (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ($\overline{OE}$) or write enable ($\overline{WE}$).

A read cycle is accomplished by asserting output enable ($\overline{OE}$) and both chip enables ($\overline{CE1}$, CE2), with write enable ($\overline{WE}$) High. The chip drives I/O pins with the data word referenced by the input address. When either chip enable or output enable is inactive, or write enable is active, output drivers stay in high-impedance mode.

All chip inputs and outputs are TTL-compatible, and operation is from a single 5V supply. The AS7C164 is packaged in all high volume industry standard packages.

Absolute maximum ratings

Parameter	Symbol	Min	Max	Unit
Voltage on any pin relative to GND	V_t	−0.5	+7.0	V
Power dissipation	P_D	–	1.0	W
Storage temperature (plastic)	T_{stg}	−55	+150	°C
Temperature under bias	T_{bias}	−10	+85	°C
DC output current	I_{out}	–	20	mA

NOTE: Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Truth table

$\overline{CE1}$	CE2	$\overline{WE}$	$\overline{OE}$	Data	Mode
H	X	X	X	High Z	Standby (I_{SB}, I_{SB1})
X	L	X	X	High Z	Standby (I_{SB}, I_{SB1})
L	H	H	H	High Z	Output disable
L	H	H	L	D_{out}	Read
L	H	L	X	D_{in}	Write

Key: X = Don't Care, L = Low, H = High

Figure C: Output load for t_{CLZ}, t_{CHZ}
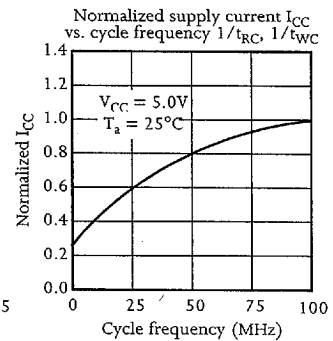

*including scope and jig capacitance

## Notes

1   During V_{CC} power-up, a pull-up resistor to V_{CC} on $\overline{CE1}$ is required to meet I_{SB} specification.
2   This parameter is sampled and not 100% tested.
3   For test conditions, see *AC Test Conditions*, Figures A, B, C.
4   t_{CLZ} and t_{CHZ} are specified with CL = 5pF as in Figure C. Transition is measured ±500mV from steady-state voltage.
5   This parameter is guaranteed but not tested.
6   $\overline{WE}$ is High for read cycle.
7   $\overline{CE1}$ and $\overline{OE}$ are Low and CE2 is High for read cycle.
8   Address valid prior to or coincident with $\overline{CE1}$ transition Low and CE2 transition High.
9   All read cycle timings are referenced from the last valid address to the first transitioning address.
10 $\overline{CE1}$ or $\overline{WE}$ must be High or CE2 Low during address transitions.
11 All write cycle timings are referenced from the last valid address to the first transitioning address.
12 $\overline{CE1}$ and CE2 have identical timing.
