ICS1561

T-52-33-49

Differential Output Video Dot Clock Generator

Features

- High frequency operation for extended video modes - up to 180 MHz
- Compatible with Brooktree high performance RAMDACs™
- Low Cost - Eliminates need for multiple ECL crystal clock oscillators in video display subsystems
- Strobed /Transparent frequency select options
- Mask-programmable frequencies
- Fast acquisition of selected frequencies, strobed or non-strobed
- Advanced PLL for low phase-jitter
- Dynamic control of VCO sensitivity providing optimized loop gain over entire frequency range
- Small footprint - 20 pin DIP or SO

Applications

- Workstations
- High resolution MACII displays
- EGA - VGA - Super VGA video adapters
- 8514A - TMS 34010 - TMS 34020

B

Description

The ICS1561 Dot Clock Generator is an integrated circuit capable of generating up to 32 video dot clock frequencies for use with high performance video display systems. Utilizing CMOS technology to implement all linear, digital and memory functions, the ICS1561 provides a low power, small footprint, low cost solution to the generation of video dot clocks. Output frequencies are compatible with VGA, EGA, MCGA, CGA, MDA, as well as the higher frequencies needed for advanced applications in desktop publishing and workstation graphics. Provision is made via a single level custom mask to implement customer specific frequency sets. Phase-locked loop circuitry permits rapid glitch-free transitions between clock frequencies. The ICS1561 provides positive ECL outputs compatible with RAMDAC™ clock and clock* inputs. TTL compatible clocks at 1, 1/2, 1/4, and 1/8 the primary clock frequency facilitate the interfacing of video DRAM to the system.

Pin Configuration

FS1	1	20	FS2
FS0	2	19	FS3
STROBE	3	18	FS4
VDD	4	17	AVSS
XTAL1	5	16	FDIV8
XTAL2	6	15	FDIV4
FOUT	7	14	FDIV2
VSS	8	13	CLK
RESERVED	9	12	CLKN
AVDD	10	11	VDDO

Circuit and Application Options

Digital Inputs

FS0 (2), FS1 (1), FS2 (20), FS3(19), and FS4(18) are the TTL compatible frequency select inputs for the binary code corresponding to the frequency desired. STROBE (3), when high, allows new data into the frequency select latches; and, when low, prevents address changes. The internal power-on-clear signal will force an initial frequency code corresponding to an all zeros input state.

ICS tailors the upper frequency limits of the ICS1561 to satisfy the frequency requirements of the application. This prevents frequency excursions of the dot clock beyond the capabilities of the graphics chipset.

Applications

Layout Considerations

Utilizing the ICS1561 in video graphics applications is simple, but does require precautions in board layout if satisfactory jitter-free performance is to be realized. A low series inductance bypass capacitor of .047 μ F should be utilized between digital Vss (8) and VDD (4). AVss (17) should be connected to ground at the card edge connector, and care should be exercised in ensuring that components not related to the ICS1561 do not use this ground. In applications utilizing a multi-layer board, both AVss and Vss should be directly connected to the ground plane. In a 5 Volt only system, AVDD should be isolated from VDD with a 100 Ω resistor and should be decoupled with a 2.2 μ F tantalum capacitor in parallel with a .047 μ F ceramic capacitor. The .047 μ F ceramic should be physically close to AVDD as is practical, to ensure low lead inductances between AVDD and AVss. A 4.7 Volt zener diode and an appropriate dropping resistor to power the analog circuitry may be used instead of the 2.2 μ F tantalum capacitor. This should be connected to the +12 volt supply, and will provide improved noise rejection and require less board space. The .047 μ F capacitor should still be utilized to provide high frequency bypassing. CLK and CLKN connections to the RAMDAC™ should follow good ECL interconnection practice. Terminating resistors should be as close as possible to the RAMDAC™.

Pin Functions

Pin Name	Pin Number	Description
FS0	2	- Frequency select input, TTL compatible (LSB)
FS1	1	- Frequency select input, TTL compatible
FS2	20	- Frequency select input, TTL compatible
FS3	19	- Frequency select input, TTL compatible
FS4	18	- Frequency select input, TTL compatible (MSB)
STROBE	3	- Negative edge clock for select inputs, TTL compatible
FOUT	7	- Clock output, TTL compatible
XTAL1	5	- Crystal Interface / Ext. oscillator input
XTAL2	6	- Crystal Interface
VDD	4	- 5 Volt power pin
AVDD	10	- Analog VDD input
Vss	8	- Digital ground
AVss	17	- Analog ground
Phaseout	9	- Phase comparator output
CLOCK	13	- Clock output, positive ECL
CLOCKN	12	- Complementary clock output, positive ECL
Fdiv2	14	- Clock/2 output, TTL compatible
Fdiv4	15	- Clock/4 output, TTL compatible
Fdiv8	16	- Clock/8 output, TTL compatible
VDDO	11	- Output stage VDD supply pin

ICS1561

Frequency Reference

The internal reference oscillator contains all of the passive components required. An appropriate series resonant crystal should be connected between XTAL1 (5) and XTAL2 (6). In IBM™-compatible applications this will typically be a 14.31818 MHz crystal, but crystals between 5MHz and 25 MHz may be used. Maintain short lead lengths between the crystal and the ICS1561. In some applications, it may be desirable to utilize the bus clock. To do this, connect the clock through a .047uF capacitor to XTAL1 (5) and keep the lead length of the capacitor to XTAL1 (5) to a minimum to reduce noise susceptibility. This input is internally biased at VDD2. Since TTL compatible clocks typically exhibit a VOH of 3.5V, capacitively coupling the input restores noise immunity. The ICS1561 is not sensitive to the duty cycle of the bus clock; however, the quality of this signal varies considerably with different motherboard designs. As the quality of the bus clock is typically outside the control of the graphics adapter card manufacturer, it is suggested that this signal be buffered on the graphics adapter board. XTAL2 (6) must be left open in this configuration.

Output Circuit Considerations

The CLK and CLKN outputs are each connected to the drains of P-Channel MOSFET devices. The source of each of these devices is connected to VDD0. Typical on resistance of each device is 15 Ohms. Typically, these outputs will drive the clock and clock• of a RAMDAC™ device. The inputs of the RAMDAC™ should have a 220 ohm resistor connected to +5V and a 330 ohm resistor connected to ground as physically close to the RAMDAC as practical.

Typical Output Configuration

NOTE: RAMDAC is a trademark of Brooktree Corporation.

ICS1561

Absolute Maximum Ratings

Ambient Temperature under bias	T_o	0 °C to 70 °C
Supply Voltage	V_{DD}	-0.5V to +7V
Input Voltage	V_{IN}	-0.5V to $V_{DD} + 0.5V$
Output Voltage	V_{OUT}	-0.5V to $V_{DD} + 0.5V$
Clamp Diode Current	$V_{IK} \& I_{OK}$	+/-30mA
Output Current per Pin	I_{OUT}	+/-50mA
Storage Temperature	T_s	-85 °C to +150 °C
Power Dissipation	P_D	500mW

Values beyond these ratings may damage the device. This device contains circuitry to protect the inputs and outputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid applications of any voltage higher than the maximum rated voltages. For proper operation it is recommended that V_{IN} and V_{OUT} be constrained to $> = V_{SS}$ and $< = V_{DD}$.

DC Characteristics (Power Supply Voltage 4.75- 5.25 Volts)

SYMBOL	PARAMETER	MIN	MAX	UNITS	CONDITIONS
V_{IL}	Input Low Voltage	V_{SS}	0.8	V	$V_{DD} = 5V$
V_{IH}	Input High Voltage	2.0	V_{DD}	V	$V_{DD} = 5V$
I_{IH}	Input Leakage Current	-	10	μA	$V_{in} = V_{DD}$
V_{OL}	Output Low Voltage	-	0.4	V	$I_{OL} = 8.0 mA$
V_{OH}	Output High Voltage	2.4	-	V	$I_{OH} = 4.0 mA$
I_{DD}	Supply Current	-	30	mA	$V_{DD} = 5V$
R_{UP}	Internal Pullup Resistors	25	100	K ohms	$V_{DD} = 5V$
C_{in}	Input Pin Capacitance	-	8	pF	$F_C = 1 MHz$
C_{out}	Output Pin Capacitance	-	12	pF	$F_C = 1 MHz$

AC Timing Characteristics

The following notes apply to all of the parameters presented in this section:

1. REFCLK = 14.318 MHz
2. All units are in nanoseconds (ns).
3. Rise and fall time is between 0.8 and 2.0 VDC for TTL I/O.
4. Output pin loading = 25pF.
5. Duty cycle is measured at 1.4V for TTL I/O.

SYMBOL	PARAMETER	MIN	MAX	NOTES
Strobe Timing				
T_{strobe}	Strobe Pulse Width	20	-	
T_{su}	Setup Time Data to Enable	20	-	
T_{hd}	Hold Time Data to Enable	10	-	
Reference Input Clock				
T_r	Rise Time	-	10	
T_f	Fall Time	-	10	
CLK and CLK Timings				
T_r	Rise Time	-	3	ns
T_f	Fall Time	-	3	Duty Cycle 40% min. to 60% max.
-	Frequency Error	-	0.5	%
-	Maximum Frequency	-	180	MHz
