128Kx32-Bit Synchronous Burst SRAM

FEATURES

- Synchronous Operation.
- On-Chip Address Counter.
- Write Self-Timed Cycle.
- On-Chip Address and Control Registers.
- Single 3.3V+0.3V/-0.165V Power Supply.
- 5V Tolerant Inputs except I/O Pins.
- Byte Writable Function.
- Global Write Enable Controls a full bus-width write.
- Power Down State via ZZ Signal.
- Asynchronous Output Enable Control.
- ADSP, ADSC, ADV Burst Control Pins.
- LBO Pin allows a choice of either a interleaved burst or a linear burst.
- Three Chip Enables for simple depth expansion with No Data Contention.
- TTL-Level Three-State Output.
- 100-TQFP-1420A

GENERAL DESCRIPTION

The KM732V787 is 4,194,304 bits Synchronous Static Random Access Memory designed to support zero wait state performance for advanced Pentium/Power PC based system. And with CS₁ high, ADSP is blocked to control signals.

It can be organized as 128K words of 32 bits. And it integrates address and control registers, a 2-bit burst address counter and high output drive circuitry onto a single integrated circuit for reduced components counts implementation of high performance cache RAM applications.

Write cycles are internally self-timed and synchronous.

The self-timed write feature eliminates complex off chip write pulse shaping logic, simplifying the cache design and further reducing the component count.

Burst cycle can be initiated with either the address status processor(ADSP) or address status cache controller(ADSC) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance(ADV) input.

ZZ pin controls Power Down State and reduces Stand-by current regardless of CLK.

The KM732V787 is implemented with SAMSUNG's high performance CMOS technology and is available in a 100pin TQFP package. Multiple power and ground pins are utilized to minimize ground bounce.

FUNCTION DESCRIPTION

The KM732V787 is a synchronous SRAM designed to support the burst address accessing sequence of the Pentium and Power PC based microprocessor. All inputs (with the exception of $\overline{OE}$, LBO and ZZ) are sampled on rising clock edges. The start and duration of the burst access is controlled by $\overline{ADSC}$, $\overline{ADSP}$ and $\overline{ADV}$ and chip select pins.

When ZZ is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When ZZ returns to low, the SRAM normally operates after 2cycles of wake up time. ZZ pin is pulled down internally.

Read cycles are initiated with $\overline{ADSP}$ (or $\overline{ADSC}$) using the new external address clocked into the on-chip address register when both $\overline{GW}$ and $\overline{BW}$ are high or when $\overline{BW}$ is low and $\overline{WEa}$, $\overline{WEb}$, $\overline{WEc}$, and $\overline{WEd}$ are high. When $\overline{ADSP}$ is sampled low, the chip selects are sampled active, and the output buffer is enabled with $\overline{OE}$. the data of cell array accessed by the current address are projected to the output pins.

Write cycles are also initiated with $\overline{ADSP}$ (or $\overline{ADSC}$) and are differentiated into two kinds of operations; All byte write operation and individual byte write operation.

All byte write occurs by enabling $\overline{GW}$ (independent of $\overline{BW}$ and $\overline{WEx}$), and individual byte write is performed only when $\overline{GW}$ is high and $\overline{BW}$ is low. In KM732V787, a 128Kx32 organization, $\overline{WEa}$ controls DQa0 ~ DQa7, $\overline{WEb}$ controls DQb0 ~ DQb7, $\overline{WEc}$ controls DQc0 ~ DQc7 and $\overline{WEd}$ controls DQd0 ~ DQd7.

$\overline{CS1}$ is used to enable the device and conditions internal use of $\overline{ADSP}$ and is sampled only when a new external address is loaded.

$\overline{ADV}$ is ignored at the clock edge when $\overline{ADSP}$ is asserted, but can be sampled on the subsequent clock edges. The address increases internally for the next access of the burst when $\overline{ADV}$ is sampled low.

Addresses are generated for the burst access as shown below, The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the LBO pin. When this pin is Low, linear burst sequence is selected. And this pin is High, Interleaved burst sequence is selected.

BURST SEQUENCE TABLE

(Interleaved Burst)

$\overline{LBO}$ PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A ₁	A ₀	A ₁	A ₀	A ₁	A ₀	A ₁	A ₀
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	0	0	1	1	1	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	1	0	0	1	0	0

(Linear Burst)

$\overline{LBO}$ PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A ₁	A ₀	A ₁	A ₀	A ₁	A ₀	A ₁	A ₀
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	1	0	1	1	0	0
	↓	1	0	1	1	0	0	0	1
	Fourth Address	1	1	0	0	0	1	1	0

NOTE : 1. LBO pin must be tied to high or low, and floating state must not be allowed.

ASYNCHRONOUS TRUTH TABLE

(See Notes 1 and 2):

Operation	ZZ	$\overline{OE}$	I/O Status
Sleep Mode	H	X	High-Z
Read	L	L	DQ
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

NOTE

1. X means "Don't Care".
2. ZZ pin is pulled down internally
3. For write cycles that following read cycles, the output buffers must be disabled with $\overline{OE}$, otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

NOTE : 1. X means "Don't Care".

2. The rising edge of clock is symbolized by ↑.

3. $\overline{WRITE}$ = L means Write operation in WRITE TRUTH TABLE.

$\overline{WRITE}$ = H means Read operation in WRITE TRUTH TABLE.

4. Operation finally depends on status of asynchronous input pins($\overline{ZZ}$ and $\overline{OE}$).

NOTE : 1. All address inputs must meet the specified setup and hold times for all rising clock edges whenever $\overline{\text{ADSC}}$ and/or $\overline{\text{ADSP}}$ is sampled low and $\overline{\text{CS}}$ is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
 2. Both chip selects must be active whenever $\overline{\text{ADSC}}$ or $\overline{\text{ADSP}}$ is sampled low in order for the this device to remain enabled.
 3. $\overline{\text{ADSC}}$ or $\overline{\text{ADSP}}$ must not be asserted for at least 2 Clock after leaving ZZ state.
 4. At any given voltage and temperature, t_{hzc} is less than t_{lzc}.
