

# TDA7590

## Digital signal processing IC for speech and audio applications

Preliminary Data

### Features

- 24-bit, fixed point, 120 MIPS DSP core
- Large on-board memory (128KW-24 bit)
- Host access to internal RAM through expansion port
- Access to external RAM (16Mw) through expansion port
- Integrated stereo, 18-bit Sigma-DELTA A/D and 20-bit D/A converters
- Programmable CODEC sample rate up to 48KHz
- On-board PLL for core clock and converters
- External flash / SRAM memory bank management
- I<sup>2</sup>C and SCI serial interface for external control
- 2 ESSI interface
- JTAG interface
- Host interface
- 144-pin TQFP, 0.50mm pitch
- Automotive temperature range (from -40°C to +85°C)

### Description

The TDA7590 is a high performances, fully programmable 24-bit, 120 MIPS. Digital Signal Processor (DSP), designed to support several speech and audio applications, as Automatic Speech Recognition, Speech Synthesis, MP3 Decoding, Echo and Noise Cancellation.

### Order codes

Part number	Package	Packing
E-TDA7590 <sup>(1)</sup>	TQFP144 (20x20x1.0 exposed pad down)	Tube
E-TDA7590TR <sup>(1)</sup>		Tape & Reel

1. ECOPACK® (see [Chapter 9](#))

Nevertheless, the embedded CODECs bandwidth and the generic processing engine allow to proceed also full-band audio signals. The large amount of on-chip memory (128 Kwords), together with the 16 Mwords external memory addressable and the 32 general purpose I/O pins permit to build a DSP-system avoiding the usage of an additional Microcontroller.

The presence of serial and parallel interfaces allows easy connection with external devices including CODECs, DSPs, Microprocessors and Personal Computers.

In particular, the Debug/JTAG interface permits the on-chip emulation of the firmware developed. Further, the presence of the Timers and Watchdog Block makes TDA7590 suitable for PWM processing and allows the integration of a system Watchdog.

### Applications

Real time digital speech and audio processing: speech recognition, speech synthesis, speech compression, echo canceling, noise canceling, MP3 decoding.

## 2.2 Pin function

Table 1. Pin function

N°	Name	Type	Description
1	SRD1/TI02	I/O	Serial Receive Data. Serial input data for receiver. Timer 2 input/output.
2	STD1	I/O	Serial Transmit Data. Serial output data from transmitter.
3	SC02	I/O	Serial Control 2. Transmitter frame sync only in asynchronous mode, transmitter and receiver frame sync in synchronous mode.
4	SC01	I/O	Serial Control 1. Receive frame sync in asynchronous mode, output from transmitter 2 or serial flag 1 in synchronous mode.
5	DE_N	I/O	Test Data Output(Input/Output). Debug Request input and Acknowledge output.
6	NMI_N	I	Non-maskable interrupt/ PINIT. Used to enable the PLL during RESET and as a non-maskable interrupt at all other times.
7	SRD0	I/O	Serial Receive Data. Serial input data for receiver.
8	IOVDD	I	IO Power Supply.
9	IOVSS	I	IO Ground.
10	STD0	I/O	Serial Transmit Data. Serial output data from transmitter.
11	SC10/SCL	I/O	ESSI1 Serial Control 0. Receive clock in asynchronous mode, output from transmitter or serial flag in synchronous mode. I <sup>2</sup> C SCL. Serial Clock Line.
12	SC00	I/O	Serial Control 0. Receive clock in asynchronous mode, output from transmitter 1 or serial flag 0 in synchronous mode.
13	RXD	I/O	SCI Receive Data. Receives byte-oriented serial data.
14	TXD	I/O	SCI Read Enable. Transmits serial data from SCI transmit shift register.
15	SCLK	I/O	SCI Serial Clock. Input or output clock from which data is transferred in synchronous mode and from which the transmit and/or receive baud rate is derived in asynchronous mode.
16	SCK1/TI01	I/O	Serial Clock. Serial bit clock for transmitter only in asynchronous mode, serial bit clock for both receiver and transmitter in synchronous mode. Timer 1 input/output.
17	SCK0	I/O	Serial Clock. Serial bit clock for transmitter only in asynchronous mode, serial bit clock for both receiver and transmitter in synchronous mode.
18	RESETN	I	System Reset. A low level applied to RESET_N input initializes the IC.
19	SCANEN	I	SCAN Enable. When active with TESTEN also active, controls the shifting of the internal scan chains.
20	TESTEN	I	Test Enable. When active, puts the chip into test mode and muxes the XT1 clock to all flip-flops. When SCANEN is also active, the scan chain shifting is enabled.
21	COREVSS	I	Core Ground.
22	COREVDD	I	Core Power Supply.
23	TIO0	I/O	Timer 0 input/output.

Table 1. Pin function (continued)

N°	Name	Type	Description
24	VSSSUB	I	Analog substrate isolation.
25	DAC1	O	DAC1 left single analog output.
26	DAC0M	O	DAC0 negative right differential analog output.
27	DAC0P	O	DAC0 positive right differential analog output.
28	CODEC_VSS	I	Voltage Ground.
29	REF0	I	Codec Power Supply.
30	CODEC_VDD	I	Codec Reference.
31	ADC1	I	ADC1 left single analog input.
32	ADC0M	I	DAC0 negative right differential analog inputs.
33	ADC0P	I	DAC0 positive right differential analog inputs.
36	EXTDACLK	I	External DAC clock. Optional external clock source from which LRCLK and SCLK can be generated.
37	XTI	I	Crystal Oscillator Input. External Clock Input or crystal connection.
38	XTO	O	Crystal Oscillator Output. Crystal Oscillator output drive.
39	PLL_VDD	I	PLL Power Supply.
40	PLL_VSS	I	PLL Ground Input .
41	HDS	I/O	Host Data Strobe. Polarity programmable Host data strobe input for single strobe mode. Polarity programmable Host write strobe input for double strobe mode.
42	HRW	I/O	Host Read/Write. Host read/write for single strobe bus mode. Polarity programmable Host read data strobe for double strobe mode.
43	HACK	I/O	Host Acknowledge. Polarity programmable host interrupt acknowledge for single host request mode. Polarity programmable host receive request interrupt for double host request mode.
44	HREQ	I/O	Host Request. Polarity programmable host request interrupt for single host request mode. Polarity programmable host transfer request interrupt for double host request mode.
45	IOVDD	I	IO Power Supply.
46	IOVSS	I	IO Ground.
47	HCS	I/O	Host Chip Select. Polarity programmable host chip select for non-multiplexed mode. Host address Line 10 for multiplexed mode.
48	HA9	I/O	Host Address 9. Address line 9 in multiplexed mode otherwise address line 2 in non-multiplexed mode.
49	HA8	I/O	Host Address 8. Address line 8 in multiplexed mode otherwise address line 1 in non-multiplexed mode.
50	HAS	I/O	Host Address Strobe. Address Strobe for multiplexed bus or Address 0 for non multiplexed.

Table 1. Pin function (continued)

N°	Name	Type	Description
51	HAD[7]	I/O	Host 8-bit data line 7. Host Data Bus and/or address lines when in multiplexed mode.
52	HAD[6]	I/O	Host 8-bit data line 6. Host Data Bus and/or address lines when in multiplexed mode.
53	HAD[5]	I/O	Host 8-bit data line 5. Host Data Bus and/or address lines when in multiplexed mode.
54	HAD[4]	I/O	Host 8-bit data line 4. Host Data Bus and/or address lines when in multiplexed mode.
55	COREVDD	I	Core Power Supply.
56	COREVSS	I	Core Ground.
57	HAD[3]	I/O	Host 8-bit data line 3. Host Data Bus and/or address lines when in multiplexed mode.
58	HAD[2]	I/O	Host 8-bit data line 2. Host Data Bus and/or address lines when in multiplexed mode.
59	HAD[1]	I/O	Host 8-bit data line 1. Host Data Bus and/or address lines when in multiplexed mode.
60	HAD[0]	I/O	Host 8-bit data line 0. Host Data Bus and/or address lines when in multiplexed mode.
61	AA[3]	O	Address Attributes line 3.Port A address attributes/chip select pins with programmable polarity.
62	AA[2]	O	Address Attributes line 2.Port A address attributes/chip select pins with programmable polarity.
63	BR_N	O	Bus Request. Asserted when Port A requires bus mastership to perform off-chip accesses.
64	BB_N	I/O	Bus Busy. Asserted by Port A when bus_busy_in_n is negated and BG_N is asserted.
65	IOVDD	I	IO Power Supply.
66	IOVSS	I	IO Ground.
67	WEN_N	O	Write Enable.
68	OEN_N	O	Output Enable.
69	AA[1]	O	Address Attributes line 1.Port A address attributes/chip select pins with programmable polarity.
70	AA[0]	O	Address Attributes line 0.Port A address attributes/chip select pins with programmable polarity.
71	BG_N	I	Bus Grant. When asserted, Port A becomes the bus master elect. Bus mastership is attained when bus busy is negated by the current bus master.
72	AB[0]	O	Address Bus line 0. Port A external address bus.
73	AB[1]	O	Address Bus line 1. Port A external address bus.
74	IOVDD	I	IO Power Supply.

Table 1. Pin function (continued)

N°	Name	Type	Description

124	DB[18]	I/O	Data Bus line 18. Port A external data bus.
125	DB[19]	I/O	Data Bus line 19. Port A external data bus.
126	COREVDD	I	Core Power Supply.
127	COREVSS	I	Core Ground.
128	DB[20]	I/O	Data Bus line 20. Port A external data bus.
129	IOVDD	I	IO Power Supply.
130	IOVSS	I	IO Ground.
131	DB[21]	I/O	Data Bus line 21. Port A external data bus.
132	DB[22]	I/O	Data Bus line 22. Port A external data bus.
133	DB[23]	I/O	Data Bus line 23. Port A external data bus.
134	IRQA	I	Interrupt Request line/ Mode control. Used as mode control during RESET and as interrupt request line at all other times.
135	IRQB	I	Interrupt Request line/ Mode control. Used as mode control during RESET and as interrupt request line at all other times.
136	IRQC	I	Interrupt Request line/ Mode control. Used as mode control during RESET and as interrupt request line at all other times.
137	IRQD	I	Interrupt Request line/ Mode control. Used as mode control during RESET and as interrupt request line at all other times.
138	TRSTN	I	Test Reset. JTAG output pin for serial data out from debug interface.
139	TDI	I	Test Data Input. JTAG input pin for serial data input for debug interface.
140	TCK	I	Test Clock. JTAG input pin for clocking debug interface.

Table 1. Pin function (continued)

N°	Name	Type	Description
141	TMS	I	Test Mode Select. JTAG input pin for control of TAP Controller of debug interface.
142	TDO	O	Test Data Output. JTAG output pin for serial data out from debug interface.
143	SC12	I/O	Serial Control 2. Transmitter frame sync only in asynchronous mode, transmitter and receiver frame sync in synchronous mode.
144	SC11/SDA	I/O	Serial Control 1. Receive frame sync in asynchronous mode, output from transmitter 2 or serial flag 1 in synchronous mode. I <sup>2</sup> C SDA. Serial Data Line.

## 2.3 Thermal data

Table 2. Thermal data

Symbol	Parameter	Value	Unit
R <sub>th-j-pins</sub>	Thermal Resistance Junction to Pins	32	°C/W

## 3 Key parameters

### 3.1 Power consumption

Power consumption depends on application running and DSP clock frequency.

Supply current values are measured and guaranteed at testing level by adopting the benchmarking program reported in Appendix 1.

**Table 3. Key parameters**

Symbol	Parameter	Min.	Typ.	Max.	Unit
<b>General</b>					
fosc	Crystal frequency			16	MHz
CORE_VDD	Operating voltage	1.62	1.8	1.98	V
CODEC_VDD	Operating voltage	3.0	3.3	3.6	V
IOVDD	Operating voltage	3.0	3.3	3.6	V
PLL_VDD	Operating voltage	3.0	3.3	3.6	V
IDD_1.8V	Supply current			150	mA
IDD_3.3V	Supply current			50	mA
Tamb	Operating temperature	-40		85	°C
<b>DSP Core</b>					
fdsp	DSP clock frequency			120	MHz
<b>ADC Single Ended</b>					
Vpp	Maximum Input Range at ADC1			1.4	V
THD/S	Total Harmonics Distortion to Signal		-71		dB
(THD+N)/S	(THD + Noise) to Signal		-70		dB
DR	Dynamic Range		75		dB
ICL	Interchannel Isolation		-100		dB
<b>ADC Differential</b>					
Vpp	Maximum Input Range at ADC0M-ADC0P			2.8	V
THD/S	Total Harmonics Distortion to Signal		-65		dB
(THD+N)/S	(THD + Noise) to Signal		-65		dB
DR	Dynamic Range		84		dB
ICL	Interchannel Isolation		-100		dB
<b>DAC Single Ended</b>					
Vpp	Maximum Input Range at ADC1			1.4	V
THD/S	Total Harmonics Distortion to Signal		-64		dB
(THD+N)	(THD + Noise) to Signal		-60		dB

**Table 3. Key parameters (continued)**

Symbol	Parameter	Min.	Typ.	Max.	Unit
DR	Dynamic Range		89		dB
ICL	Interchannel Isolation		-100		dB
<b>DAC Differential</b>					
V <sub>pp</sub>	Maximum Input Range at ADC1			2.8	V
THD/S	Total Harmonics Distortion to Signal		-58		dB
(THD+N)/S	(THD + Noise) to Signal		-57		dB
DR	Dynamic Range		90		dB
ICL	Interchannel Isolation		-85		dB

### 3.1.1 CODEC (ADC/DAC) Test Description

Reported typical values (table 3. - ADC and DAC sections) have been measured at Lab level during product evaluation phase. General definitions and procedures are separately defined in following dedicated paragraphs.

#### Total Harmonic Distortion with Noise to Signal (THD+N)/S

THD+N is defined as the ratio of the total power of the second power and higher harmonic with noise components to the power of the fundamental for that signal. For THD+N measurement, choose the DSP analyzer in Digital analyzer with THD ratio as measurement option. Measure the THD+N value at -3dB amplitude of the input signal. First measure the THD+N value at 1V<sub>rms</sub> which is 0dB reference and then measure the value at -3dB reference.

#### Dynamic Range (DR)

DR is defined as the level of THD+N measured when the input sine wave amplitude is so small that no harmonics apart from the fundamental tone are present in the output signal. This way THD+N becomes practically the ratio between the whole signal and noise floor, being a different way to express SNR. As a convention, at which no harmonics should be present in the output signal, it is fixed at -40dB of the full scale amplitude.

#### Crosstalk or Interchannel Isolation

A disturbance, caused by electromagnetic interference, along a circuit or a cable pair. An electric signal disrupts another signal in an adjacent circuit and can cause it to become confused and cross over each other. Crosstalk is measured by applying a signal -3dB amplitude of input signal at one channel (A) and no signal at an other channel (B), measuring the effect on this channel(B) because of the channel (A).

#### Total Harmonic Distortion to Signal (THD)/S

THD is defined as the ratio of the sum of only those components of the output signal which are harmonic of system input, after having removed the fundamental tone corresponding to the pure sine wave as input and the input signal. This measurement is done by using the Harmonic analyzer which can isolate up to 15th harmonic components on the acquired signal and report the sum of all of them, centering the fundamental tone on the frequency provided by the input signal generator. These measurements are performed at -3dB reference amplitude of input signal.

## 4 Electrical specification

### 4.1 Absolute maximum ratings

Table 4. Absolute maximum ratings

Symbol	Parameter	Value	Unit
PLL_VDD	3.3V PLL Power Supply Voltage	-0.5 to 4	V
CODEC_VDD	3.3V CODEC Analog Power Supply	-0.5 to 4	V
IOVDD	3.3V IO Power Supply	-0.5 to 4	V
CORE_VDD	1.8V CORE Power Supply	-0.5 to 2.2	V
IO_MAX	Input or Output Voltage	-0.5 to (IOVDD +0.5)	V

### 4.2 Electrical characteristics for I/O pins

Table 5. Recommended DC operating conditions

Symbol	Parameter	Value	Unit
IOVDD	IO Power Supply Voltage	3 to 3.6 (*)	V
T <sub>j</sub>	Operating Junction Temperature	-40 to 105	°C

(\*) All the specification are valid only within these recommended operating conditions.

Table 6. General interface electrical characteristics

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit
I <sub>il</sub>	Low level Input Current Without pullup device				1	μA
I <sub>ih</sub>	High level Input Current Without pulldown device				1	μA
I <sub>oz</sub>	Tri-state Output leakage Without pull up/down device				1	μA
I <sub>ozFT</sub>	Five Volt tolerant Tri-state Output leakage Without pull up/down device				1	μA
I <sub>latchup</sub>	I/O Latch-up current	V < 0V, V < V <sub>dd</sub>	200			mA
V <sub>esd</sub>	Electrostatic Protection (HBM)	leakage < 1mA	2000			V
V <sub>il</sub>	Low level input voltage <sup>(1)</sup>				0.8	V
V <sub>ih</sub>	High level input voltage <sup>(1)</sup>		2			V
V <sub>hyst</sub>	Schmitt trigger hysteresis <sup>(1)</sup>		0.4			V
V <sub>ol</sub>	Low level output voltage <sup>(1) (2) (3)</sup>	I <sub>ol</sub> = XmA			0.15	V
V <sub>oh</sub>	High level output voltage <sup>(1) (2) (3)</sup>	I <sub>oh</sub> = -XmA	IOVDD - 0.15			V

1. TTL specifications only apply to the supply voltage range V<sub>dd</sub> = 3.15V to 3.6V.

2. Takes into account 200mV voltage drop in both supply lines.

3. X is the source/sink current under worst case conditions and is reflected in the name of the I/O cell according to the drive capability.

## 5 24 bit DSP core

The DSP Core is a general purpose 24-bit DSP. The main features of the DSP Core are listed below:

- 120MHz Operating Frequency (120 MIPS)
- Fully Pipelined 24 x 24 Bit Parallel Multiplier-Accumulator
- Saturation/Limiting Logic
- 56-Bit Parallel Barrel Shifter
- Linear, Reverse Carry and Modulo Addressing Modes
- 24-bit Address Buses for Program, X and Y Data Spaces and DMA
- Memory-Expandible Hardware Stack
- Nested Zero-Overhead DO Loops
- Fast Interrupts
- Powerful JTAG Emulation Port
- Software WAIT and STOP Low Power Stand-by Modes
- Program Address Tracing Support
- Two 24-bit Data Moves in Parallel with Arithmetic Operations
- External Interrupts including Non-Maskable Interrupt
- Interrupts may be independently masked and prioritised
- Bit-Manipulation instructions can access any register or memory location
- On board support for DMA Controller

## 6 Memories

128K x 24 Bit RAM divided into 4 areas, Program RAM(PRAM), X data RAM(XRAM), Y data RAM(YRAM) and flexible allocation RAM(FLEX) as follows:

- 16K PRAM
- 40K FLEX RAM. FLEX RAM is accessed through the expansion port by the DSP core.
- External access to the FLEX RAM is also supported.
- 72K RAM is allocated as XRAM and YRAM. Four configurations are supported:
  - 4K XRAM and 68K YRAM
  - 8K XRAM and 64K YRAM
  - 16K XRAM and 56K YRAM
  - 24K XRAM and 48K YRAM

## 7 DSP peripherals

### 7.1 Serial Audio Interface (SAI)

The SAI is used to communicate between the CODEC and the DSPs.

In addition, digital audio can be directly input for processing. There is only one SAI found on the chip that can be accessed by either the DSP or the DMA controller. The main features of this block are listed below:

- Slave Operating Modes, all clock lines can be inputs or outputs
- Transmit and Receive Interrupt Logic triggers on Left/Right data pairs
- Receive and Transmit Data Registers have two locations to hold left and right data

### 7.2 Serial Communication Interface (SCI)

The Serial Communication Interface provides a full duplex port for serial communication to other DSPs, microprocessors, and peripherals like modems.

The interface supports the following features:

- No additional logic for connection to other TTL level peripherals
- Asynchronous bit rates and protocols " High speed synchronous data transmission.
- Asynchronous protocol includes Multidrop mode for master/slave operation with Wakeup on Idle line and Wakeup on Address Bit capability, permitting the SCI to share a single line with multiple peripherals
- Transmit and Receive logic can operate asynchronously from each other.
- A programmable baud-rate generator which provide the transmit and receive clocks or functions as a general purpose timer.

### 7.3 I<sup>2</sup>C Interface

The inter integrated-circuit bus is a simple bi-directional two-wire bus used for efficient inter IC control. All I<sup>2</sup>C bus compatible devices incorporate an on-chip interface which allows them to communicate directly with each other via the I<sup>2</sup>C bus.

Every component connected to the I<sup>2</sup>C bus has its own unique address whether it is a CPU, memory or some other complex function chip. Each of these chips can act as a receiver and/or transmitter depending on its functionality.

### 7.4 Host Interface (HI)

The host interface is a system-on-chip module that permits connection to the data bus of a host processor. The HI is capable of driving 16 programmable external pins which can be configured as an 8 bit parallel port for direct connection to a host processor.

The key features of the host interface are:

- 8 bit parallel port "Full-duplex" Dedicated host register bank
- Dedicated Mozart Core DSP register core bank.
- Register banks map directly into Mozart X memory space
- 3 transfer modes:
  - host command
  - Host to Mozart Core DSP
  - Mozart Core DSP to host
- Access protocols:
  - Software polled
  - Interrupt
  - DMA access by the Mozart Core DSP core
- 2+ wait states clock cycles per transfer
- Supported instructions:
  - Data transfer between Mozart core and external host using Mozart MOVE instruction
  - Simple I/O service routine with bit addressing instructions
  - IO service using fast interrupts with MOVEP instructions.

## 7.5 ESSI

The ESSI peripheral enables serial-port communication between the DSP core and external devices including CODECs, DSP, Microprocessors. The ESSI is capable of driving 12 programmable external pins which can be configured as GPIO ports C and D or ESSI pins.

The key features of the ESSI are:

- Independent receiver and transmitter
- Synchronous or Asynchronous channel modes Synchronous. Receiver and transmitter use same clock/sync Asynchronous. Receiver and transmitter may use separate clock/sync " Up to one transmitter enabled in asynchronous channel mode.
- Up to three transmitters enabled in synchronous channel mode.
- Normal mode. One word per period.
- Network Mode. Up to 32 words per period.

## 7.6 EOC

The Salieri Extended on-chip memory interface provides access to 40K of on-chip memory. The Mozart core will treat this memory as if it were external. Access by off-chip expansion bus masters is permitted. All accesses to the extended on-chip RAM are controlled by the extended on-chip memory control register. This register determines which combinations of the Address Attribute pins should be interpreted as accesses to the 40K of RAM.

## 7.7 Timers and Watchdog Block

The Timers and Watchdog Block consists of a common 21-bit prescaler and three independent and identical general-purpose 24-bit timer/event counters, each with its own register set.

Each timer has the following capabilities:

- Uses internal or external clocking.
- Interrupts the Mozart after a specified number of events (clocks).
- Signals an external device after counting internal events.
- Triggers DMA transfers after a specified number of events (clocks) occurs.
- Connects to the external world through designated pins TIO[0-2] for timers 0-2.

When TIO is configured as an

- Input: Timer functions as an external event counter. Timer measures external pulse width/signal period.
- Output: Timer functions as a:
  - Timer
  - Watchdog timer
  - Pulse-width modulator.

## 7.8 PLL

The PLL generates the following clocks:

- DCLK: DSP core clock
- DACLK: ADC and DAC clock
- LRCLK: left/right clock for the SAI and the CODEC
- SCLK: shift serial clock for the SAI and the CODEC

## 7.9 CODEC CELL

The main features of the CODEC cell are listed below:

- 20 bits stereo DAC, and 18bits ADC
- I<sup>2</sup>S format
- Oversampling ratio: 512
- Sampling rates of 8 kHz to 48 kHz

The analog interface is in the form of differential signals for each channel. The interface on the digital side has the form of an SAI interface and can interface directly to an SAI channel and then to the DSP core.

DCLK can be supplied either by the internal PLL or by external, to allow synchronization with external anal digital sources.

# 9 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK<sup>®</sup> packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark.

ECOPACK specifications are available at: [www.st.com](http://www.st.com).
