

**40Pin Flash Disk Module Min.8MB ~ Max.384MB, True IDE Interface  
Mode, 3.3V / 5.0V Operating** **Part No. HFDOM40P-xxxSx**

## 1. PRODUCT OVERVIEW

### GENERAL DESCRIPTION

The HFDOM40P-xxxSx series 40Pin Flash Disk Module is a flash technology based with True IDE interface flash memory card. It is constructed with flash disk controller chip and NAND-type (Samsung) flash memory device. The HFDOM40P-xxxSx series operates in both 3.3-Volt and 5.0-Volt power supplies. It comes in capacity of 8, 16, 32, 64, 128, 192, 256 MB and up to 384 MB formatted 40Pin type .

By optimizing flash memory management, the life of this HFDOM40P-xxxSx series can be extended to its maximum level. Because the ECC function is included, the correctness of data transfer between the HFDOM40P-xxxSx series and a True IDE compatible interface device can be guaranteed.

The HFDOM40P-xxxSx series is fully compatible with applications such as CPU card / board, set top box, industry / military PC / Notebook, security equipment, measuring instrument and embedded systems.

### FEATURES

- True IDE compatible host interface
- Direct plug in for 3.5" IDE Connectors
- 40 pin 2.54mm IDE Connector
- Very high performance, very low power consumption
- Automatic error correction
- Support 3 power save mode : stop/idle/active
- Support for CIS implemented with 256 bytes of attribute memory
- 3.3V/5.0V operation voltage
- Host data transfer rate : 20MB/s
- Flash data transfer rate : 10MB/s
- Host Interface bus width : 8/16 bit Access
- Flash Interface bus width : 8 bit Access
- Capacity : Min. 8MB ~ Max. 384MB
- MTBF : 1,000,000 hours, minimum 30,000 insertions
- Operating vibration : 15G peak to peak maximum
- Operating shock : 1,000G maximum

### PRODUCT SPECIFICATIONS

#### Capacities :

8, 16, 32, 64, 128, 192, 256 and up to 384 MB (formatted)

**Operating Voltage :** 3.3V / 5.0V ±10%

#### Power consumptions :

Read mode 30 mA (typ), 50 Ma (Max)

Write mode 30 mA (typ), 70 Ma (Max)

Stop mode 30 uA (typ)

#### Environment conditions :

Operating temperature 0°C to + 60°C

Storage temperature - 25°C to + 85°C

Relative humidity 95%(Max)

#### Mechanical conditions :

Weight : Maximum 9.0g

## INSTALLTION GUIDE

### 1) Setting Method

- ① Make sure your computer is turned off before you open the case.
- ② Plug the carefully into the 40pin IDE slot on your computer.  
**Caution:** Make sure to align pin1 on host adapter interface connector with pin 1 on your Flash Disk Module. Pin 1 is indicated by a triangle on the Flash Disk Module connector.
- ③ The Flash Disk Module is used power connector cable of the computer.  
**Caution:** If you need to remove your Flash Disk Module, use both hands to pull it out carefully.
- ④ Check all cable connections and then replace your computer cover.

### 2) BIOS setting Method

Before you format or partition your new drive, you must configure your computer's BIOS so that the computer can recognize your new drive.

- ① Turn your computer on. As your computer start up, watch the screen for a message describing how to run the system setup program on the screen (sometimes called BIOS or CMOS setup). This is usually done by pressing a special key, such as **Delete**, **Esc** or **F1** during startup. See your computer manual for details. Press the appropriate key to run the system setup program.
- ② **If your BIOS provides automatic drive detection (an "AUTO" drive type), select this option. ( We recommend to use Normal / CHS mode to partition your Flash Disk Module to get the maximum formatted capacity. )**

This allows your computer to configure itself automatically for your new drive.

**If your BIOS dose not provide "AUTO" drive detection, select "User-defined" drive setting and enter the CHS values from the table.** BIOS Settings (see specification) Capacity Cylinders Heads Sectors(unformatted)

- ③ Save the settings and exit the System Setup program. ( your computer will automatically reboot ) After you configure your computer, you can use the standard DOS commands to partition and format your Flash Disk Module, as described below.

### 3) Formatting Method

To partition your new Flash Disk Module with Microsoft DOS program :

- ① Insert a bootable DOS diskette into your diskette drive and restart your computer.
- ② Insert a DOS program diskette that contains the **FDISK.EXE** and **FORMAT.COM** programs into your diskette drive. Use the same DOS version that is on your bootable diskette. At the **A:\ >** prompt, type **"FDISK"** and press **Enter**.
- ③ Select **"Create DOS partition or logical DOS drive"** by pressing **1**. Then press **Enter**.
- ④ Select **"Create primary DOS partition"** by pressing **1** again. Then press **Enter**. Create your first drive partition. If you are creating a partition that will be used to boot your computer (drive C), make sure that the partition is marked active.
- ⑤ Create an extended partition and additional logical drives as necessary, until all the space on your new hard drive has been partitioned.
- ⑥ When the partitioning is complete, **FDISK** reboots your computer.  
**Caution:** Make sure to use the correct drive letters so that you do not format a drive that already contains data.
- ⑦ At the **A:\ >** prompt, type **"format c:/s"**, where **c** is the letter of your first new partition, Repeat the format process for all the new partitions you have created.
- ⑧ After you format your drive, it is ready to use.

## Signal Descriptions

Table 2.2 Signal Descriptions

Signal Name	Dir.	Pin	Description
A[2:0]	I	33,35,36	In True IDE Mode only A[2:0] are used to select the one of eight registers in the Task File, the remaining address lines should be grounded by the host.
-PDIAG	I/O	34	This input / output is the Pass Diagnostic signal in the Master / Slave handshake protocol.
-DASP(LED)	I/O	39	This signal used either to drive an <b>LED</b> whenever the Disk Module is being accessed or as indication of a second drive present. This signal is active low when the Disk Module is busy.
-CS0, -CS1	I	37,38	CS0 is the chip select for the task file registers while CS2 is used to select the Alternate Status Register and the Device Control Register.
D[15:00]	I/O	3,4,5,6, 7,8,9,10, 11,12,13, 14,15,16, 17,18	All Task File operations occur in byte mode on the low order bus D00-D07 while all data transfers are 16 bit using D00-D15.
GND	--	2,19,22, 24,26, 30,40,	Ground.
-IOR	I	25	This is an I/O Read strobe generated by the host.
-IOW	I	23	The I/O Write strobe pulse is used to clock I/O data on the Card Data bus into the Storage Card controller registers when the Storage Card is configured to use the I/O interface. The clocking will occur on the negative to positive edge of the signal (trailing edge).
IRQ	O	31	In True IDE Mode signal is the active high Interrupt Request to the host.
-RESET	I	1	This input pin is the active low hardware reset from the host.
IORDY	O	27	This output signal may be used as IORDY.
-IOIS16	O	32	This output signal is asserted low when this device is expecting a word data transfer cycle.

#### ACCESS SPECIFICATIONS

##### IDE MODE I/O ACCESS SPECIFICATIONS

In this True IDE Mode the Flash Disk Module protocol and configuration are disabled and only I/O operations to the Task File and Data Register are allowed. In this mode no Memory or Attribute Registers are accessible to the host.
