CMOS
4 M × 4 BITS FAST PAGE MODE DYNAMIC RAM

MB81V16400B-50/-60

CMOS 4,194,304 × 4 BITS Fast Page Mode Dynamic RAM

■ DESCRIPTION

The Fujitsu MB81V16400B is a fully decoded CMOS Dynamic RAM (DRAM) that contains 16,777,216 memory cells accessible in 4-bit increments. The MB81V16400B features a “fast page” mode of operation whereby high-speed random access of up to 1,024-bits of data within the same row can be selected. The MB81V16400B DRAM is ideally suited for mainframe, buffers, hand-held computers video imaging equipment, and other memory applications where very low power dissipation and high bandwidth are basic requirements of the design. Since the standby current of the MB81V16400B is very small, the device can be used as a non-volatile memory in equipment that uses batteries for primary and/or auxiliary power.

The MB81V16400B is fabricated using silicon gate CMOS and Fujitsu’s advanced four-layer polysilicon and two-layer aluminum process. This process, coupled with advanced stacked capacitor memory cells, reduces the possibility of soft errors and extends the time interval between memory refreshes. Clock timing requirements for the MB81V16400B are not critical and all inputs are LVTTL compatible.

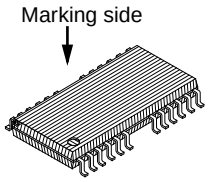
■ PRODUCT LINE & FEATURES

Parameter		MB81V16400B-50	MB81V16400B-60
$\overline{RAS}$ Access Time		50 ns max.	60 ns max.
Random Cycle Time		90 ns min.	110 ns min.
Address Access Time		25 ns max.	30 ns max.
$\overline{CAS}$ Access Time		13 ns max.	15 ns max.
Fast Page Mode Cycle Time		35 ns min.	40 ns min.
Low Power Dissipation	Operating Current	324 mW max.	270 mW max.
	Standby Current	3.6 mW max. (TTL level) / 1.8 mW max. (CMOS level)	

- 4,194,304 words × 4 bits organization
- Silicon gate, CMOS, Advanced Capacitor Cell
- All input and output are LVTTL compatible
- 4096 refresh cycles every 65.6 ms
- Early Write or $\overline{OE}$ controlled write capability
- $\overline{RAS}$ only, $\overline{CAS}$-before-$\overline{RAS}$, or Hidden Refresh
- Fast page Mode, Read-Modify-Write capability
- On chip substrate bias generator for high performance

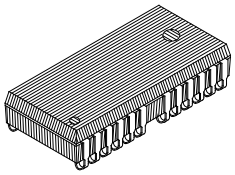
■ PACKAGE

Plastic TSOP (II) Package



(FPT-26P-M05)
(Normal Bend)

Plastic SOJ Package



(LCC-26P-M09)

Package and Ordering Information

– 26-pin plastic (300mil) TSOP (II) with normal bend leads, order as MB81V16400B-××PFTN
– 26-pin plastic (300mil) SOJ, order as MB81V16400B-××PJ

Designator	Function
DQ_1 to DQ_4	Data Input/ Output
$\overline{WE}$	Write enable
$\overline{RAS}$	Row address strobe
A_0 to A_{11}	Address inputs
V_{CC}	+3.3 volt power supply
$\overline{OE}$	Output enable
$\overline{CAS}$	Column address strobe
V_{SS}	Circuit ground

■ FUNCTIONAL TRUTH TABLE

Operation Mode	Clock Input				Address Input		Input Data		Refresh	Note
	$\overline{RAS}$	$\overline{CAS}$	$\overline{WE}$	$\overline{OE}$	Row	Column	Input	Output		
Standby	H	H	X	X	—	—	—	High-Z	—	
Read Cycle	L	L	H	L	Valid	Valid	—	Valid	Yes*	$t_{RCS} \geq t_{RCS}$ (min)
Write Cycle (Early Write)	L	L	L	X	Valid	Valid	Valid	High-Z	Yes*	$t_{WCS} \geq t_{WCS}$ (min)
Read-Modify-Write Cycle	L	L	H→L	L→H	Valid	Valid	Valid	Valid	Yes*	
$\overline{RAS}$-only Refresh Cycle	L	H	X	X	Valid	—	—	High-Z	Yes	
$\overline{CAS}$-before-$\overline{RAS}$ Refresh Cycle	L	L	H	X	—	—	—	High-Z	Yes	$t_{CSR} \geq t_{CSR}$ (min)
Hidden Refresh Cycle	H→L	L	H→X	L	—	—	—	Valid	Yes	Previous data is kept.

X: "H" or "L"

* : It is impossible in Fast Page Mode.

■ FUNCTIONAL OPERATION

ADDRESS INPUTS

Twenty-two input bits are required to decode any four of 16,777,216 cell addresses in the memory matrix. Since only twelve address bits (A_0 to A_{11}) are available, the row and column inputs are separately strobed by $\overline{RAS}$ and $\overline{CAS}$ as shown in Figure 1. First, twelve row address bits are input on pins A_0-through-A_{11} and latched with the row address strobe ($\overline{RAS}$) then, ten column address bits are input and latched with the column address strobe ($\overline{CAS}$). Both row and column addresses must be stable on or before the falling edge of $\overline{RAS}$ and $\overline{CAS}$, respectively. The address latches are of the flow-through type; thus, address information appearing after t_{RAH} (min)+ t_T is automatically treated as the column address.

WRITE ENABLE

The read or write mode is determined by the logic state of $\overline{WE}$. When $\overline{WE}$ is active Low, a write cycle is initiated; when $\overline{WE}$ is High, a read cycle is selected. During the read mode, input data is ignored.

DATA INPUT

Input data is written into memory in either of three basic ways–an early write cycle, an $\overline{OE}$ (delayed) write cycle, and a read-modify-write cycle. The falling edge of $\overline{WE}$ or $\overline{CAS}$, whichever is later, serves as the input data-latch strobe. In an early write cycle, the input data (DQ_1 to DQ_4) is strobed by $\overline{CAS}$ and the setup/hold times are referenced to $\overline{CAS}$ because $\overline{WE}$ goes Low before $\overline{CAS}$. In a delayed write or a read-modify-write cycle, $\overline{WE}$ goes Low after $\overline{CAS}$; thus, input data is strobed by $\overline{WE}$ and all setup/hold times are referenced to the write-enable signal.

DATA OUTPUT

The three-state buffers are LVTTL compatible with a fanout of one TTL load. Polarity of the output data is identical to that of the input; the output buffers remain in the high-impedance state until the column address strobe goes Low. When a read or read-modify-write cycle is executed, valid outputs are obtained under the following conditions:

t_{RAC} : from the falling edge of $\overline{RAS}$ when t_{RCD} (max) is satisfied.
t_{CAC} : from the falling edge of $\overline{CAS}$ when t_{RCD} is greater than t_{RCD} (max).
t_{AA} : from column address input when t_{RAD} is greater than t_{RAD} (max).
t_{OEA} : from the falling edge of $\overline{OE}$ when $\overline{OE}$ is brought Low after t_{RAC}, t_{CAC}, or t_{AA}.

The data remains valid until either $\overline{CAS}$ or $\overline{OE}$ returns to a High logic level. When an early write is executed, the output buffers remain in a high-impedance state during the entire cycle.

FAST PAGE MODE OF OPERATION

The fast page mode of operation provides faster memory access and lower power dissipation. The fast page mode is implemented by keeping the same row address and strobing in successive column addresses. To satisfy these conditions, $\overline{RAS}$ is held Low for all contiguous memory cycles in which row addresses are common. For each fast page of memory, any of 1,024 × 4-bits can be accessed and, when multiple MB81V16400Bs are used, $\overline{CAS}$ is decoded to select the desired memory fast page. Fast page mode operations need not be addressed sequentially and combinations of read, write, and/or read-modify-write cycles are permitted.

■ ABSOLUTE MAXIMUM RATINGS (See WARNING)

Parameter	Symbol	Value	Unit
Voltage at Any Pin Relative to V_{SS}	V_{IN}, V_{OUT}	–0.5 to +4.6	V
Voltage of V_{CC} Supply Relative to V_{SS}	V_{CC}	–0.5 to +4.6	V
Power Dissipation	P_D	1.0	W
Short Circuit Output Current	—	–50 to +50	mA
Operating Temperature	T_{OPE}	0 to +70	°C
Storage Temperature	T_{STG}	–55 to +125	°C

WARNING: Permanent device damage may occur if the above **Absolute Maximum Ratings** are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Notes	Symbol	Min.	Typ.	Max.	Unit	Ambient Operating Temp.
Supply Voltage	*1	V_{CC}	3.0	3.3	3.6	V	0°C to +70°C
		V_{SS}	0	0	0		
Input High Voltage, All Inputs	*1	V_{IH}	2.0	—	V_{CC} + 0.3	V	
Input Low Voltage, All Inputs*	*1	V_{IL}	–0.3	—	0.8	V	

* : Undershoots of up to –1.2 volts with a pulse width not exceeding 20 ns are acceptable.

■ CAPACITANCE

(T_A = 25°C, f = 1 MHz)

Parameter	Symbol	Typ.	Max.	Unit
Input Capacitance, A_0 to A_{11}	C_{IN1}	—	5	pF
Input Capacitance, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$	C_{IN2}	—	5	pF
Input/Output Capacitance, DQ_1 to DQ_4	C_{DQ}	—	7	pF

■ DC CHARACTERISTICS

Notes: *1. Referenced to V_{SS}.

*2. I_{CC} depends on the output load conditions and cycle rates; the specified values are obtained with the output open. I_{CC} depends on the number of address change as $\overline{RAS} = V_{IL}$, $\overline{CAS} = V_{IH}$ and $V_{IL} > -0.3$ V. I_{CC1}, I_{CC3}, I_{CC4} and I_{CC5} are specified at one time of address change during $\overline{RAS} = V_{IL}$ and $\overline{CAS} = V_{IH}$. I_{CC2} is specified during $\overline{RAS} = V_{IH}$ and $V_{IL} > -0.3$ V.

*3. An initial pause ($\overline{RAS} = \overline{CAS} = V_{IH}$) of 200 µs is required after power-up followed by any eight $\overline{RAS}$-only cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of eight $\overline{CAS}$-before-$\overline{RAS}$ initialization cycles instead of 8 $\overline{RAS}$ cycles are required.

*4. AC characteristics assume $t_T = 5$ ns.

*5. Input voltage levels are 0 V and 3.0 V, and input reference levels are V_{IH} (min) and V_{IL} (max) for measuring timing of input signals. Also, the transition time (t_T) is measured between V_{IH} (min) and V_{IL} (max). The output reference levels are $V_{OH} = 2.0$ V and $V_{OL} = 0.8$ V.

*6. Assumes that $t_{RCD} \leq t_{RCD}$ (max), $t_{RAD} \leq t_{RAD}$ (max). If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will be increased by the amount that t_{RCD} exceeds the value shown. Refer to Fig. 2 and 3.

*7. If $t_{RCD} \geq t_{RCD}$ (max), $t_{RAD} \geq t_{RAD}$ (max), and $t_{ASC} \geq t_{AA} - t_{CAC} - t_T$, access time is t_{CAC}.

*8. If $t_{RAD} \geq t_{RAD}$ (max) and $t_{ASC} \leq t_{AA} - t_{CAC} - t_T$, access time is t_{AA}.

*9. Measured with a load equivalent to one TTL loads and 100 pF.

*10. t_{OFF} and t_{OEZ} is specified that output buffer change to high-impedance state.

*11. Operation within the t_{RCD} (max) limit ensures that t_{RAC} (max) can be met. t_{RCD} (max) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} (max) limit, access time is controlled exclusively by t_{CAC} or t_{AA}.

*12. t_{RCD} (min) = t_{RAH} (min)+ 2 t_T + t_{ASC} (min).

*13. Operation within the t_{RAD} (max) limit ensures that t_{RAC} (max) can be met. t_{RAD} (max) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (max) limit, access time is controlled exclusively by t_{CAC} or t_{AA}.

*14. Either t_{RRH} or t_{RCH} must be satisfied for a read cycle.

*15. t_{WCS} is specified as a reference point only. If $t_{WCS} \geq t_{WCS}$ (min) the data output pin will remain High-Z state through entire cycle.

*16. Assumes that $t_{WCS} < t_{WCS}$ (min).

*17. Either t_{DZC} or t_{DZO} must be satisfied.

*18. t_{CPA} is access time from the selection of a new column address (that is caused by changing $\overline{CAS}$ from "L" to "H"). Therefore, if t_{CP} is long, t_{CPA} is longer than t_{CPA} (max).

*19. Assumes that $\overline{CAS}$-before-$\overline{RAS}$ refresh.

*20. t_{WCS}, t_{CWD}, t_{RWD}, and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as an electrical characteristic only. If $t_{WCS} > t_{WCS}$ (min), the cycle is an early write cycle and DQ pin will maintain high-impedance state thoughout the entire cycle. If $t_{CWD} > t_{CWD}$ (min), $t_{RWD} > t_{RWD}$ (min), and $t_{AWD} > t_{AWD}$ (min), the cycle is a read-modify-write cycle and data from the selected cell will appear at the DQ pin. If neither of the above conditions is satisfied, the cycle is a delayed write cycle and invalid data will appear the DQ pin, and write operation can be executed by satisfying t_{RWL}, t_{CWL}, and t_{RAL} specifications.

Fig. 2 – t_{RAC} vs. t_{RCD}

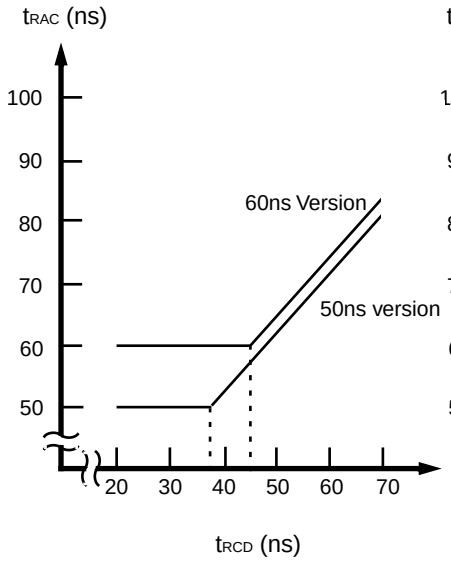

Fig. 3 – t_{RAC} vs. t_{RAD}

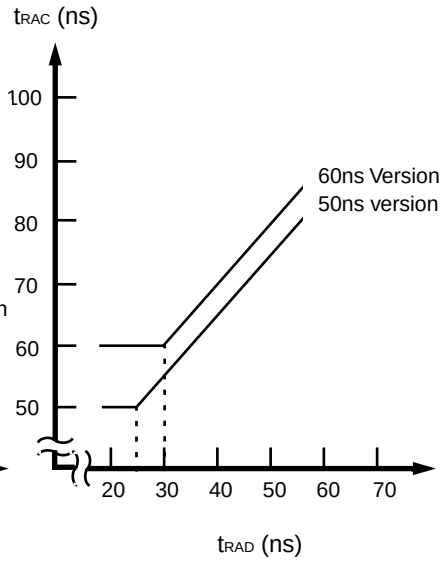

Fig. 4 – t_{CPA} vs. t_{CP}

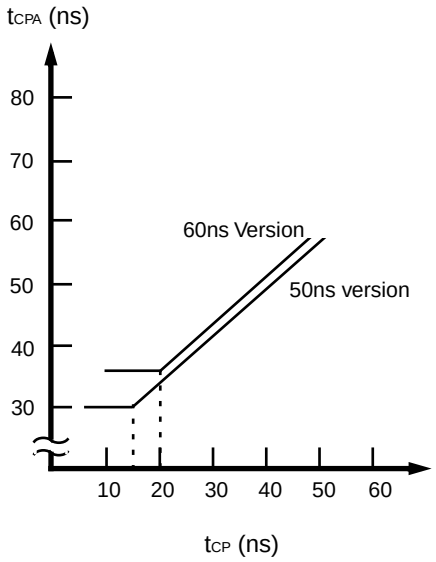

Fig. 5 – READ CYCLE

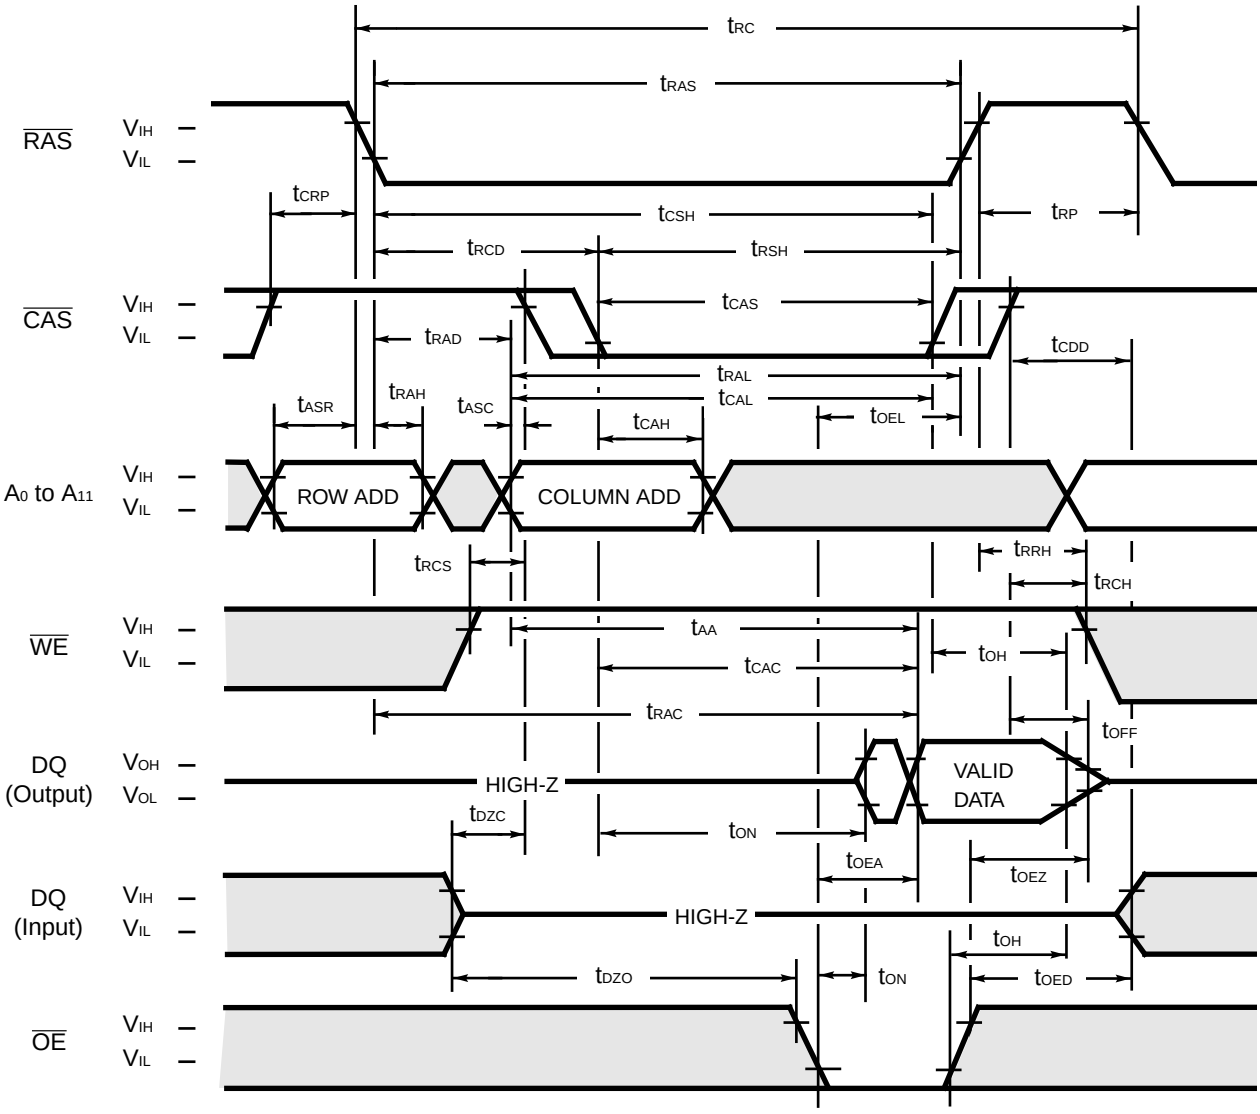


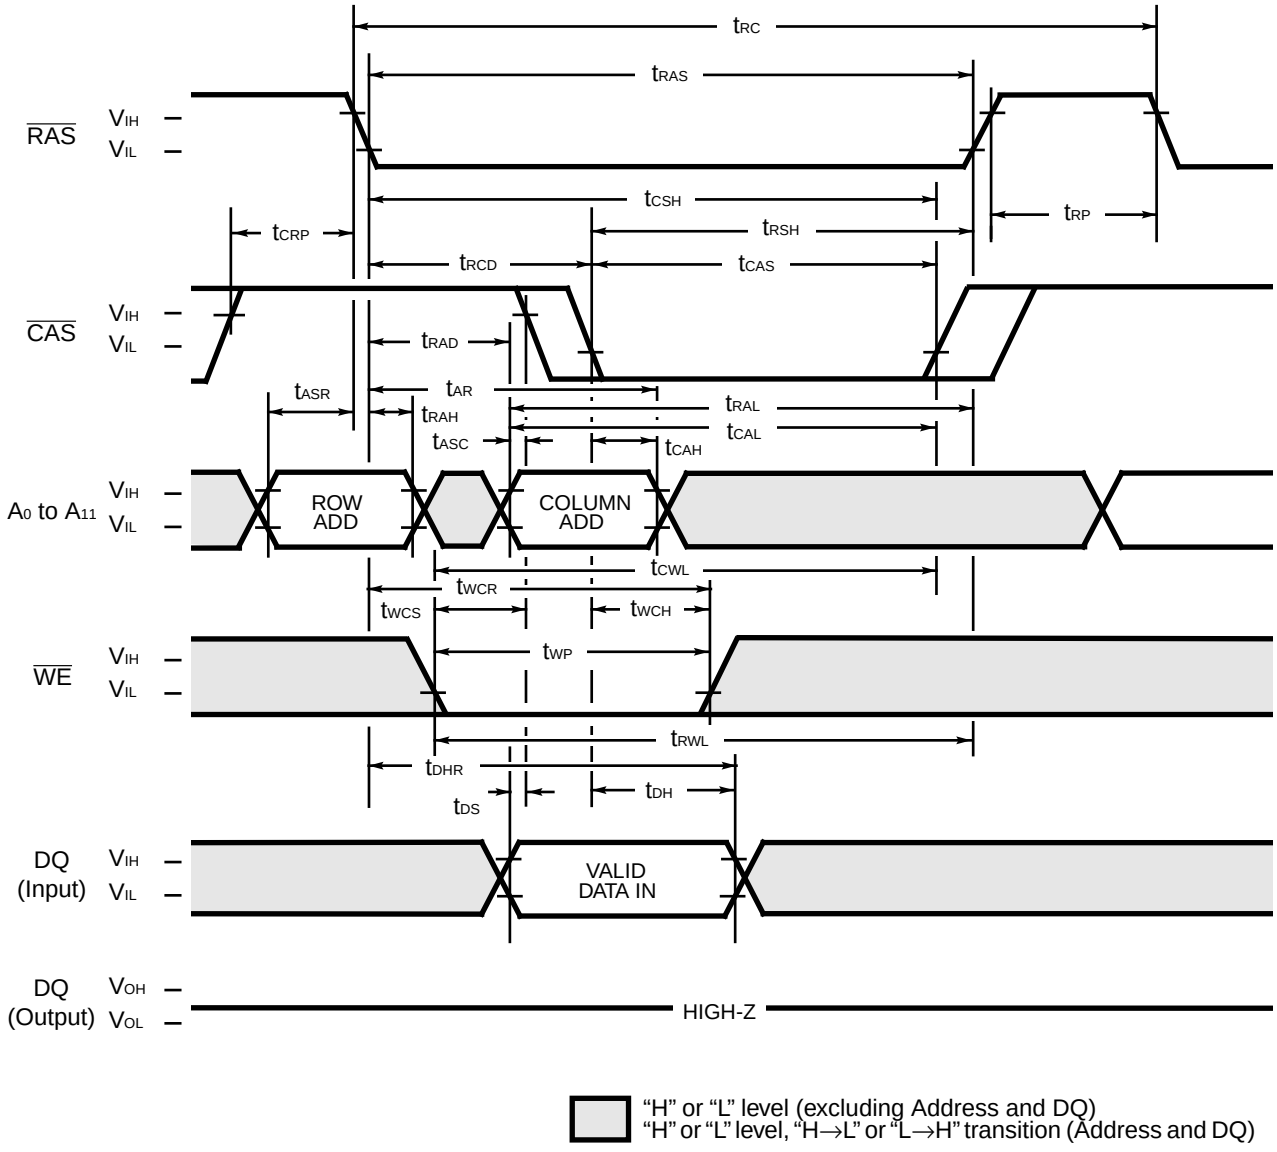
DESCRIPTION

To implement a read operation, a valid address is latched in by the $\overline{RAS}$ and $\overline{CAS}$ address strobes and with $\overline{WE}$ set to a High level and $\overline{OE}$ set to a low level, the output is valid once the memory access time has elapsed. The access time is determined by $\overline{RAS}$ (t_{RAC}), $\overline{CAS}$ (t_{CAC}), $\overline{OE}$ (t_{OEA}) or column addresses (t_{AA}) under the following conditions:

If $t_{RCD} > t_{RCD}$ (max), access time = t_{CAC}.
If $t_{RAD} > t_{RAD}$ (max), access time = t_{AA}.
If $\overline{OE}$ is brought Low after t_{RAC}, t_{CAC}, or t_{AA} (whichever occurs later), access time = t_{OEA}.

However, if either $\overline{CAS}$ or $\overline{OE}$ goes High, the output returns to a high-impedance state after t_{OH} is satisfied.

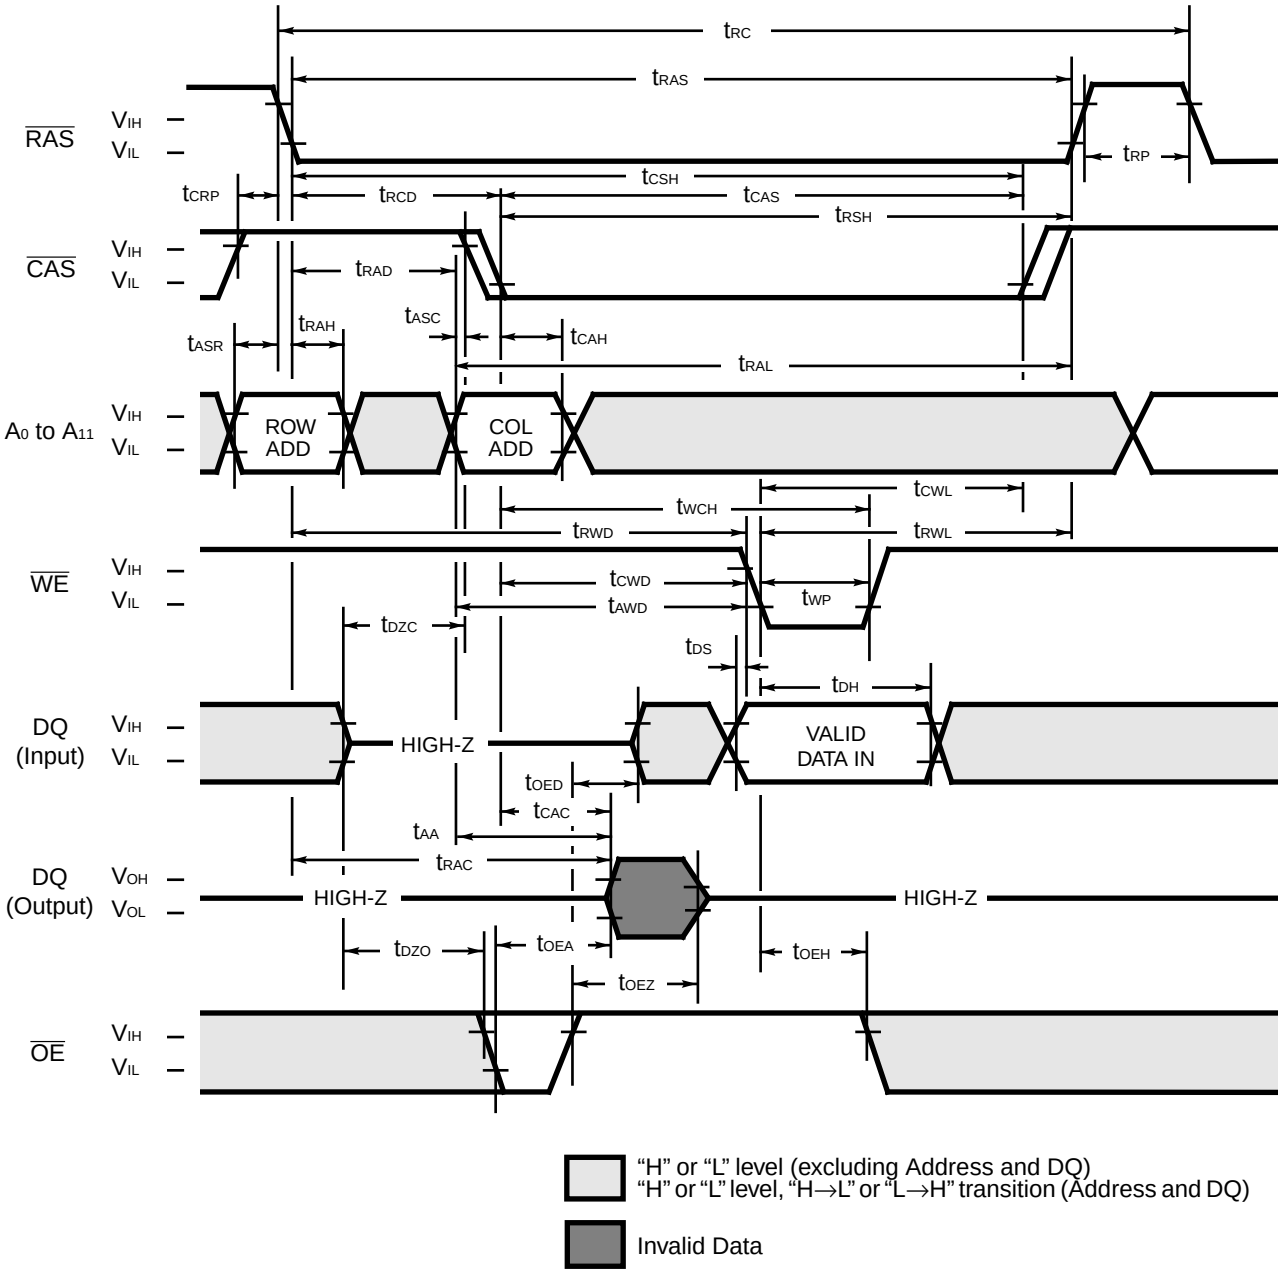
Fig. 6 – EARLY WRITE CYCLE ($\overline{OE}$ = "H" or "L")



DESCRIPTION

A write cycle is similar to a read cycle except $\overline{WE}$ is set to a Low state and $\overline{OE}$ is a "H" or "L" signal. A write cycle can be implemented in either of three ways – early write, $\overline{OE}$ write (delayed write), or read-modify-write. During all write cycles, timing parameters t_{RWL}, t_{CWL} and t_{RAL} must be satisfied. In the early write cycle shown above t_{WCS} satisfied, data on the DQ pin is latched with the falling edge of $\overline{CAS}$ and written into memory.

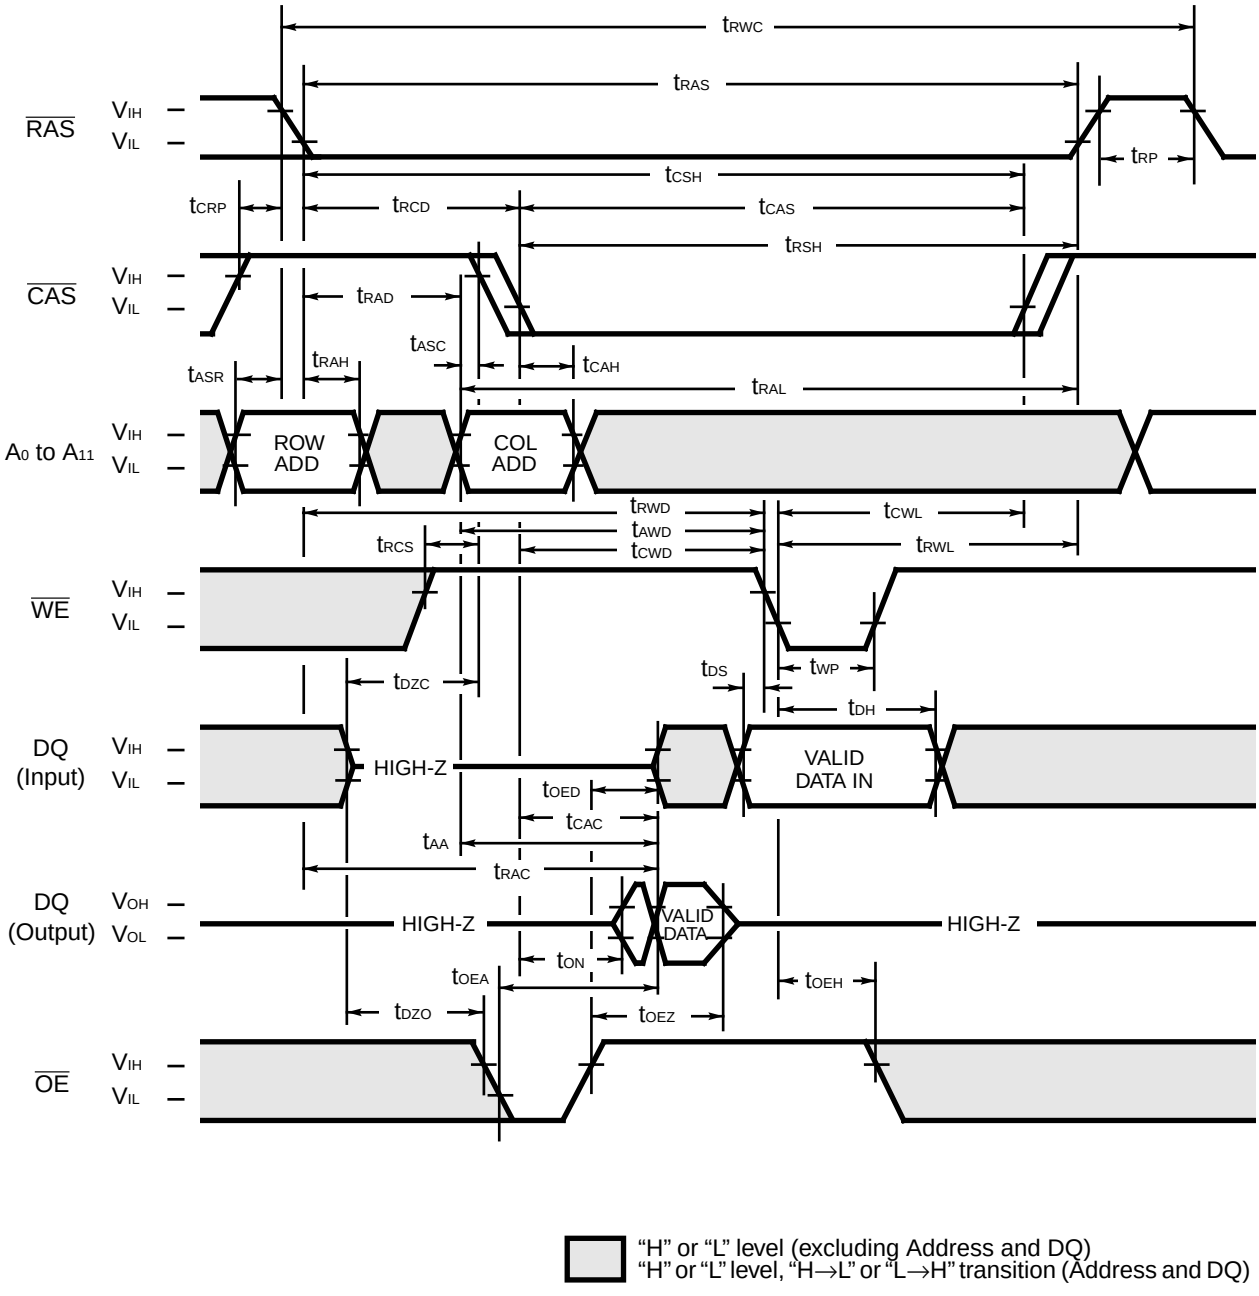
Fig. 7 – $\overline{OE}$ (DELAYED WRITE CYCLE)



DESCRIPTION

In the $\overline{OE}$ (delayed write) cycle, t_{WCS} is not satisfied ; thus, the data on the DQ pins is latched with the falling edge of $\overline{WE}$ and written into memory. The Output Enable ($\overline{OE}$) signal must be changed from Low to High before $\overline{WE}$ goes Low ($t_{OED} + t_{DS}$).

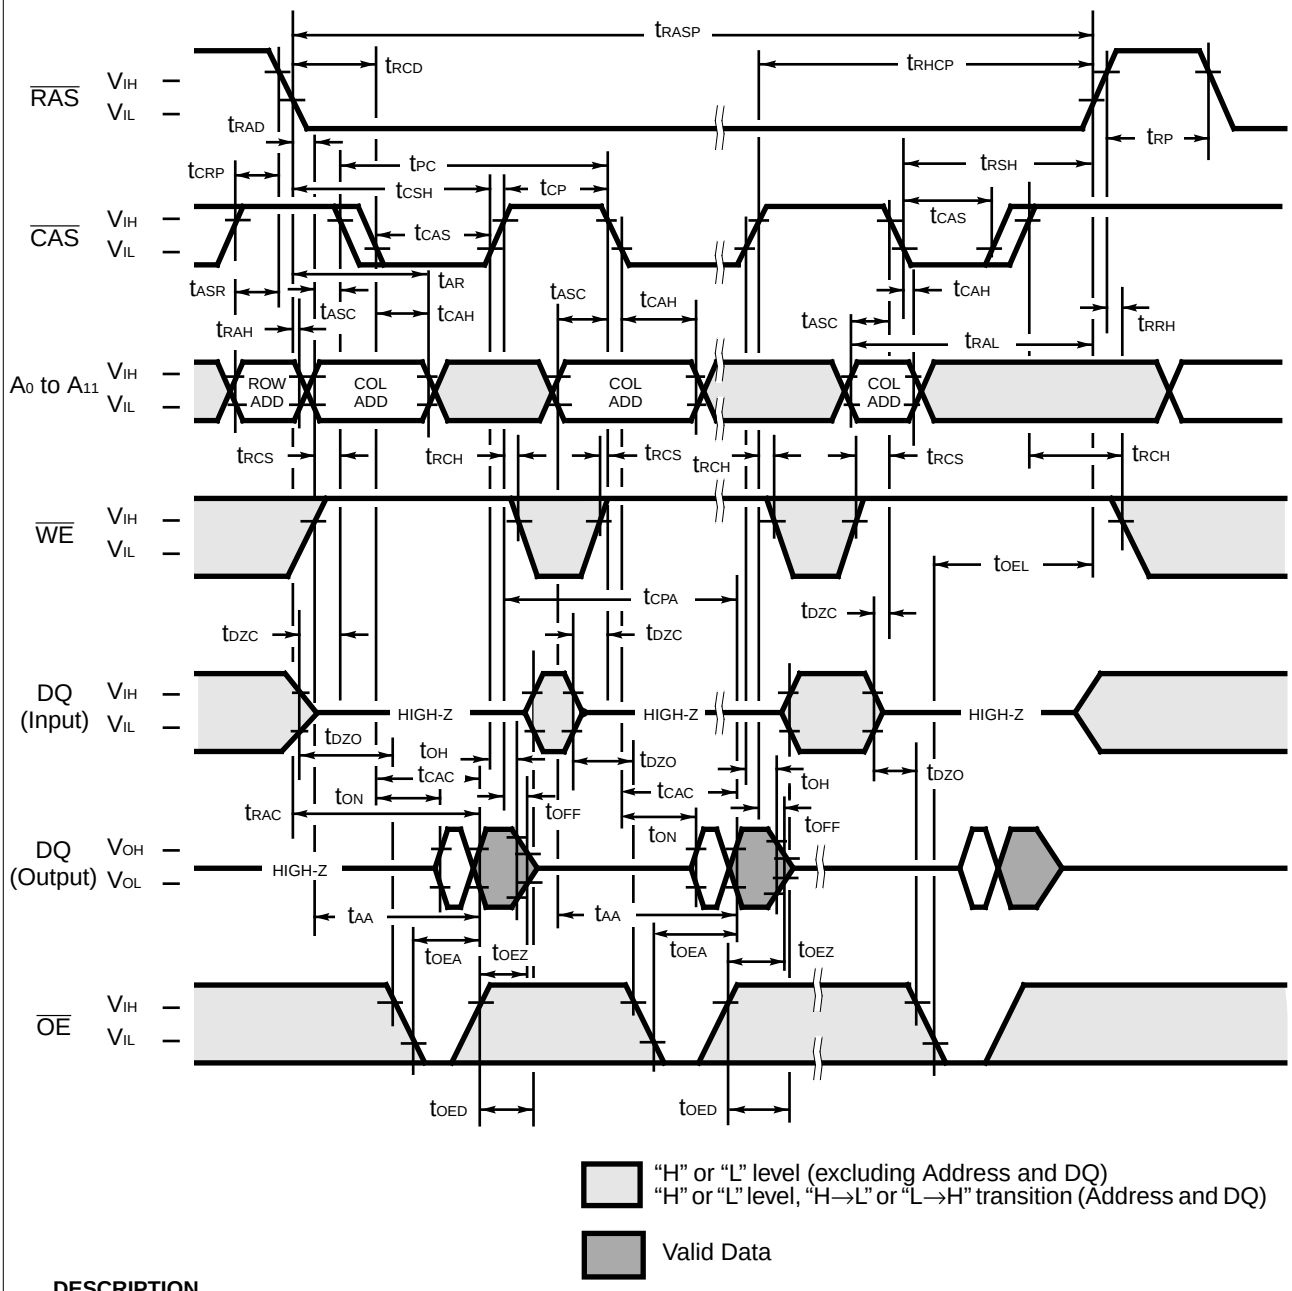
Fig. 8 – READ-MODIFY-WRITE CYCLE



DESCRIPTION

The read-modify-write cycle is executed by changing $\overline{WE}$ from High to Low after the data appears on the DQ pins. In the read-modify-write cycle, $\overline{OE}$ must be changed from Low to High after the memory access time.

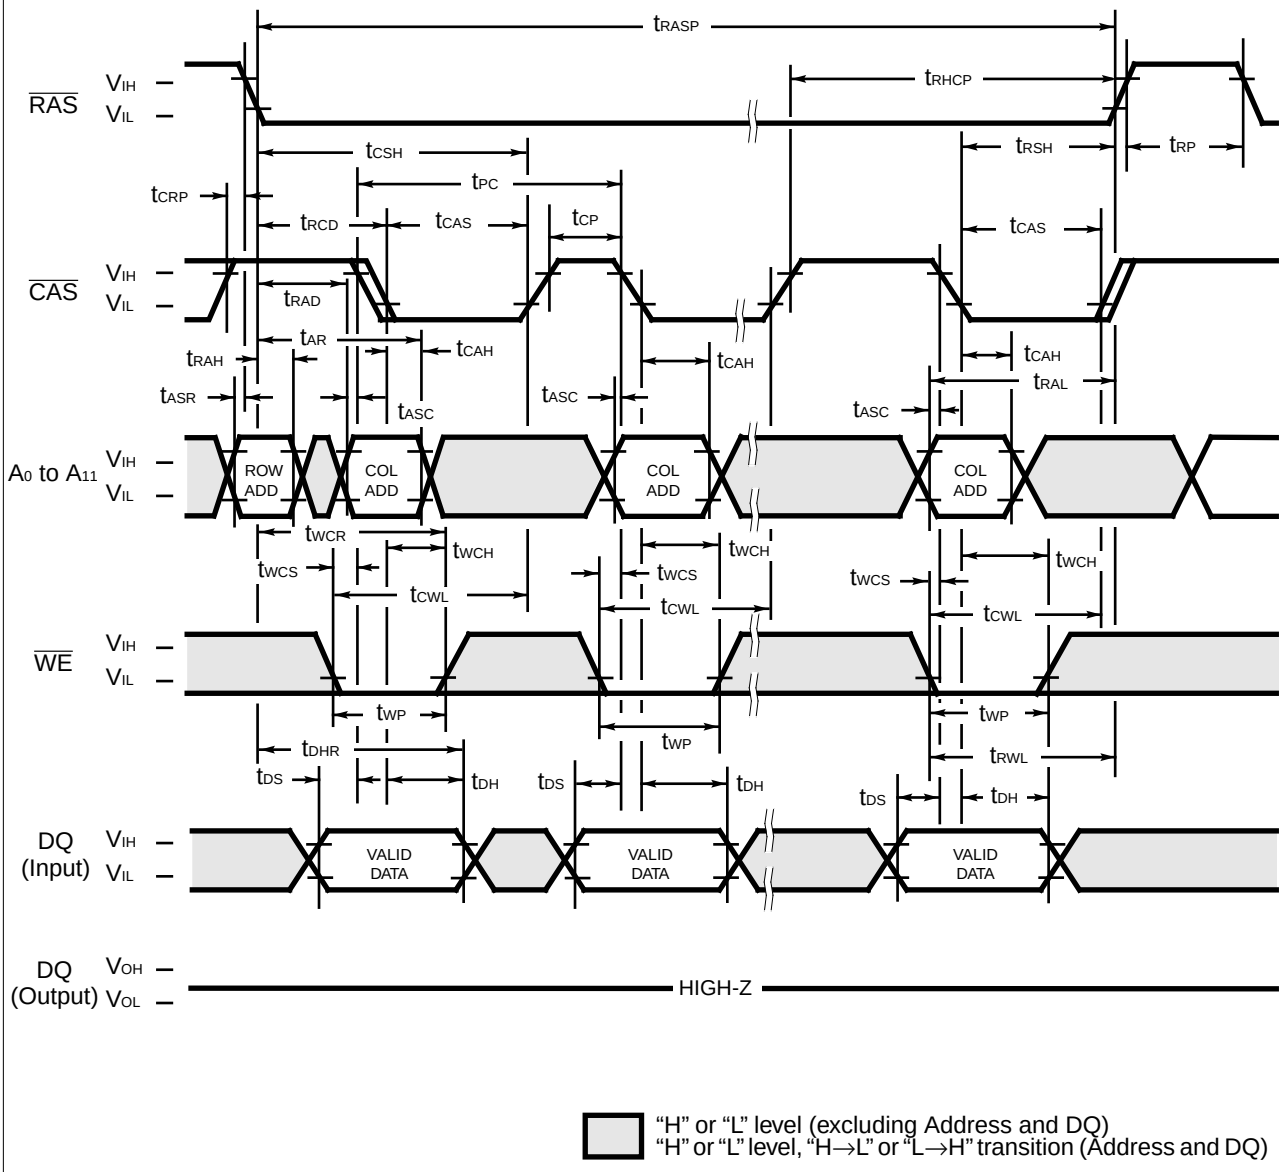
Fig. 9 – FAST PAGE MODE READ CYCLE



DESCRIPTION

The fast page mode of operation permits faster successive memory operations at multiple column locations of the same row address.
This operation is performed by strobing in the row address and maintaining $\overline{RAS}$ at a Low level and $\overline{WE}$ at a High level during all successive memory cycles in which the row address is latched. The access time is determined by t_{CAC}, t_{AA}, t_{CPA}, or t_{OEA}, whichever one is the latest in occurring.

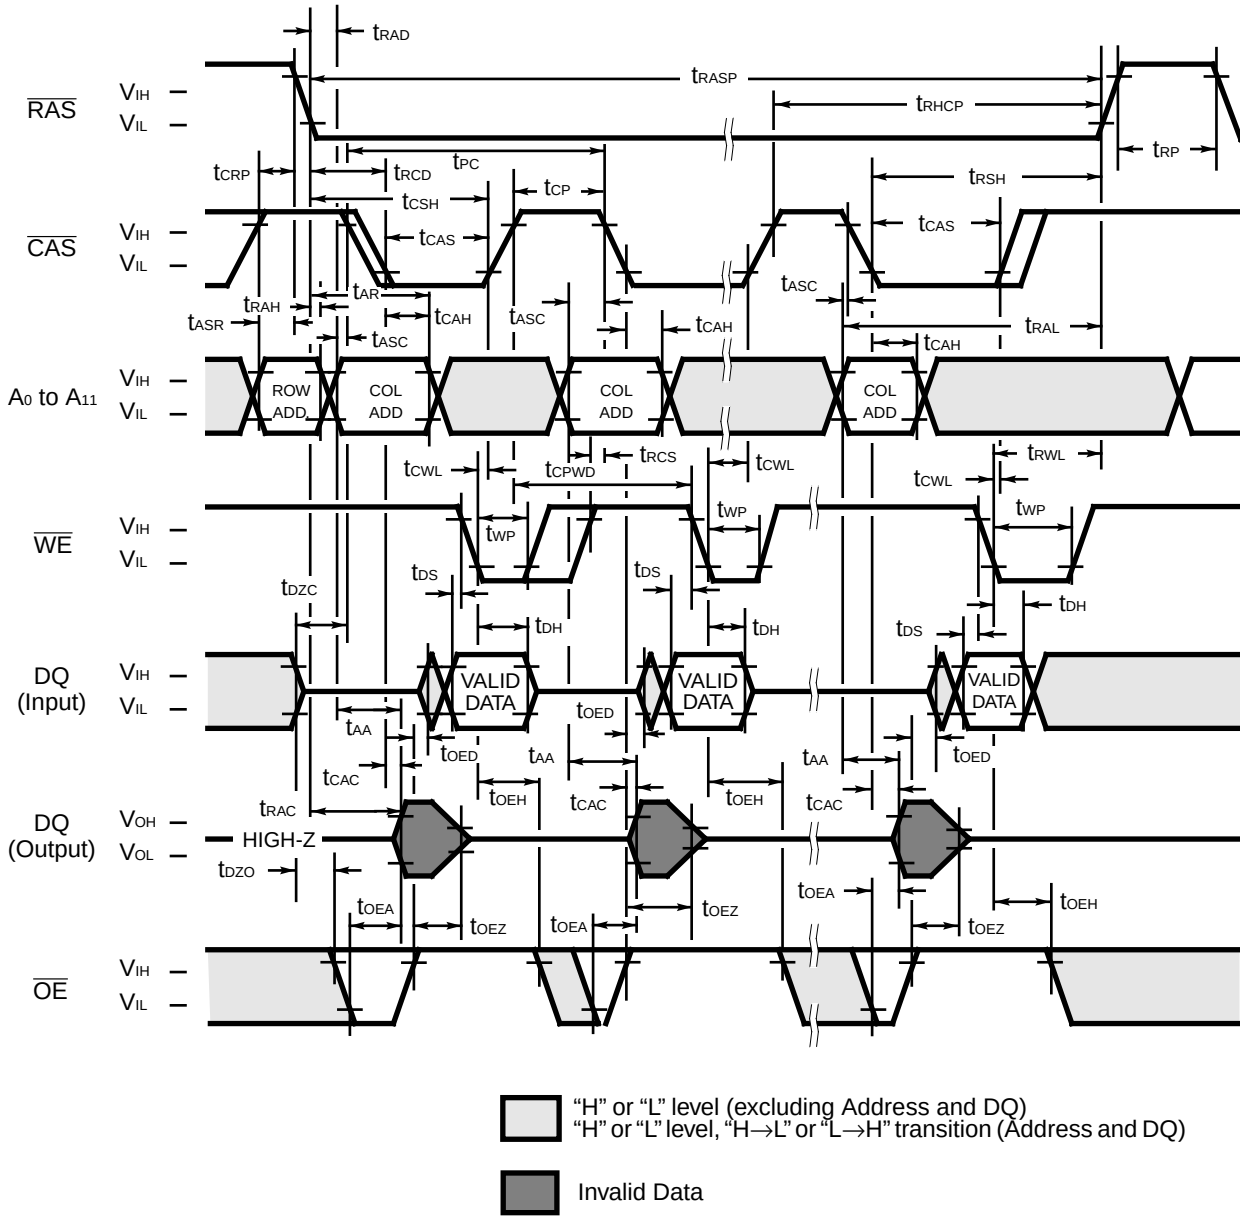
Fig. 10 – FAST PAGE MODE EARLY WRITE CYCLE ($\overline{OE}$ = "H" or "L")



DESCRIPTION

The fast page mode write cycle is executed in the same manner as the fast page mode read cycle except the states of $\overline{WE}$ and $\overline{OE}$ are reversed. Data appearing on the DQ pins is latched on the falling edge of $\overline{CAS}$ and written into memory. During the fast page mode write cycle, including the delayed ($\overline{OE}$) write and read-modify-write cycles, tCWL must be satisfied.

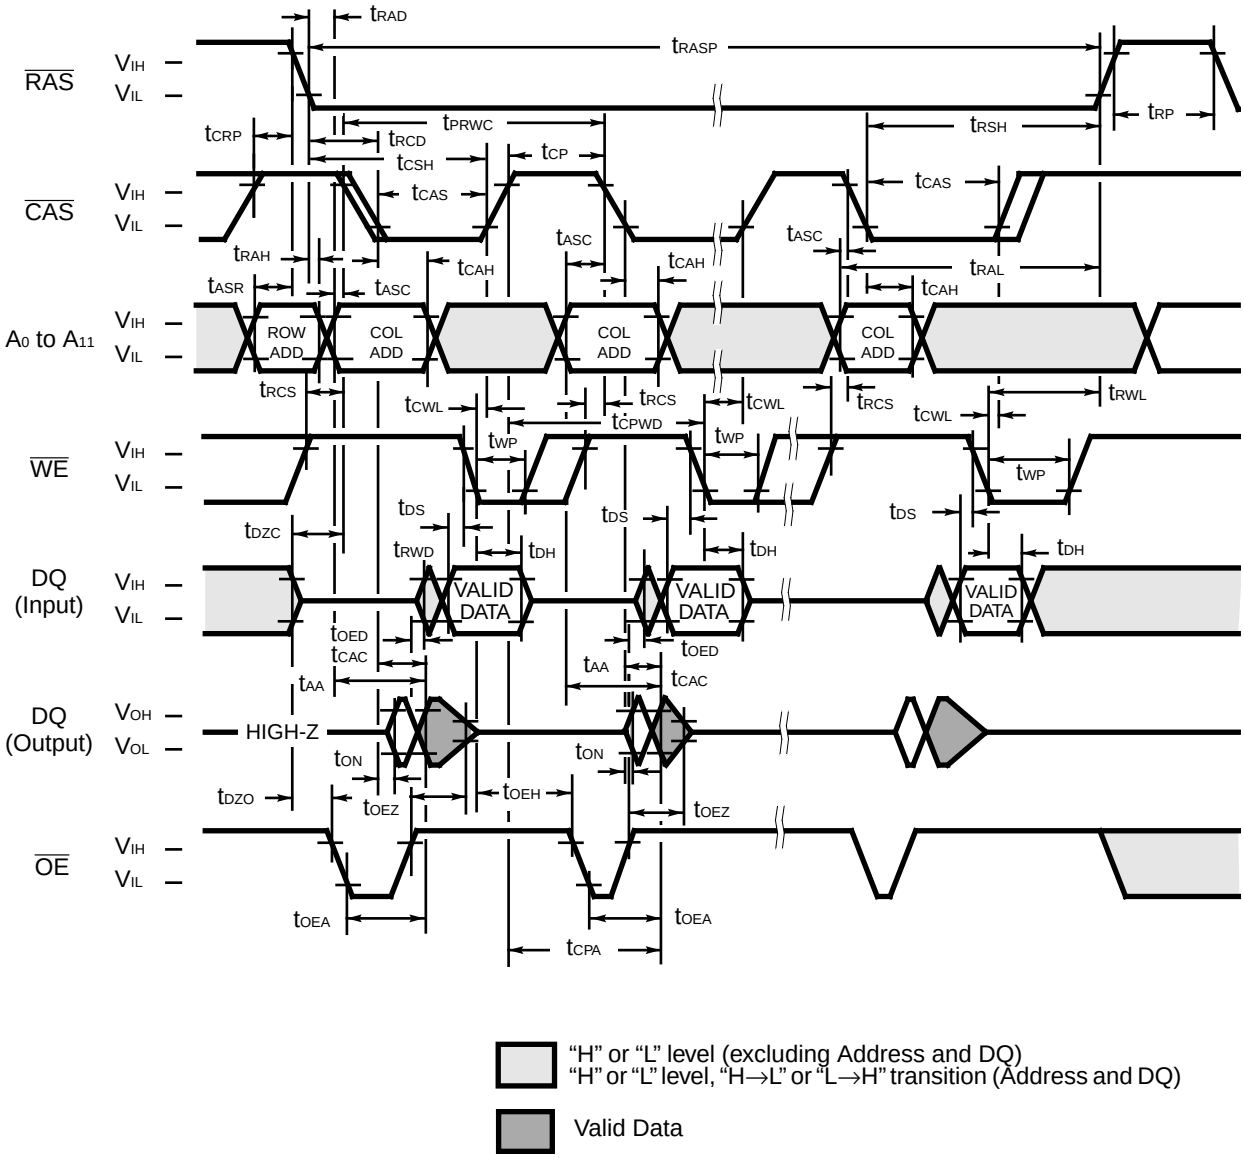
Fig. 11 – FAST PAGE MODE $\overline{OE}$ WRITE CYCLE



DESCRIPTION

The fast page mode $\overline{OE}$ (delayed) write cycle is executed in the same manner as the fast page mode write cycle except for the states of $\overline{WE}$ and $\overline{OE}$. Input data on the DQ pins are latched on the falling edge of $\overline{WE}$ and written into memory. In the fast page mode delayed write cycle, $\overline{OE}$ must be changed from Low to High before $\overline{WE}$ goes Low ($t_{OED} + t_{DS}$).

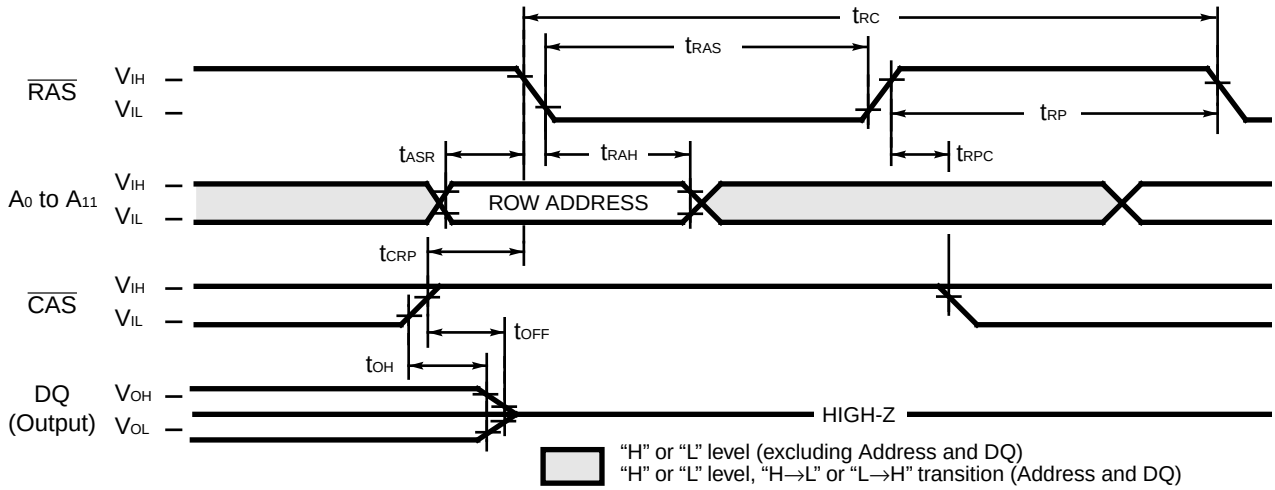
Fig. 12 – FAST PAGE MODE READ-MODIFY-WRITE CYCLE



DESCRIPTION

During the fast page mode of operation, the read-modify-write cycle can be executed by switching $\overline{WE}$ from High to Low after input date appears at the DQ pins during a normal cycle.

Fig. 13 – $\overline{RAS}$-ONLY REFRESH ($\overline{WE}$ = $\overline{OE}$ = "H" or "L")

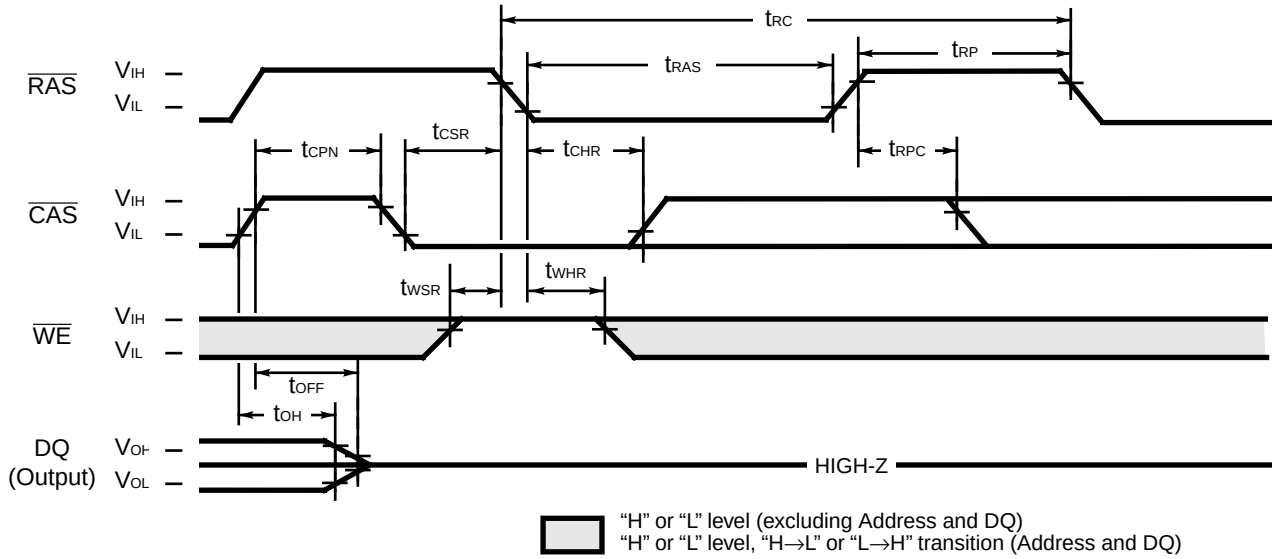


DESCRIPTION

Refresh of RAM memory cells is accomplished by performing a read, a write, or a read-modify-write cycle at each of 4096 row addresses every 65.6-milliseconds. Three refresh modes are available: $\overline{RAS}$-only refresh, $\overline{CAS}$-before-$\overline{RAS}$ refresh, and hidden refresh.

$\overline{RAS}$-only refresh is performed by keeping $\overline{RAS}$ Low and $\overline{CAS}$ High throughout the cycle; the row address to be refreshed is latched on the falling edge of $\overline{RAS}$. During $\overline{RAS}$-only refresh, DOUT pin is kept in a high-impedance state.

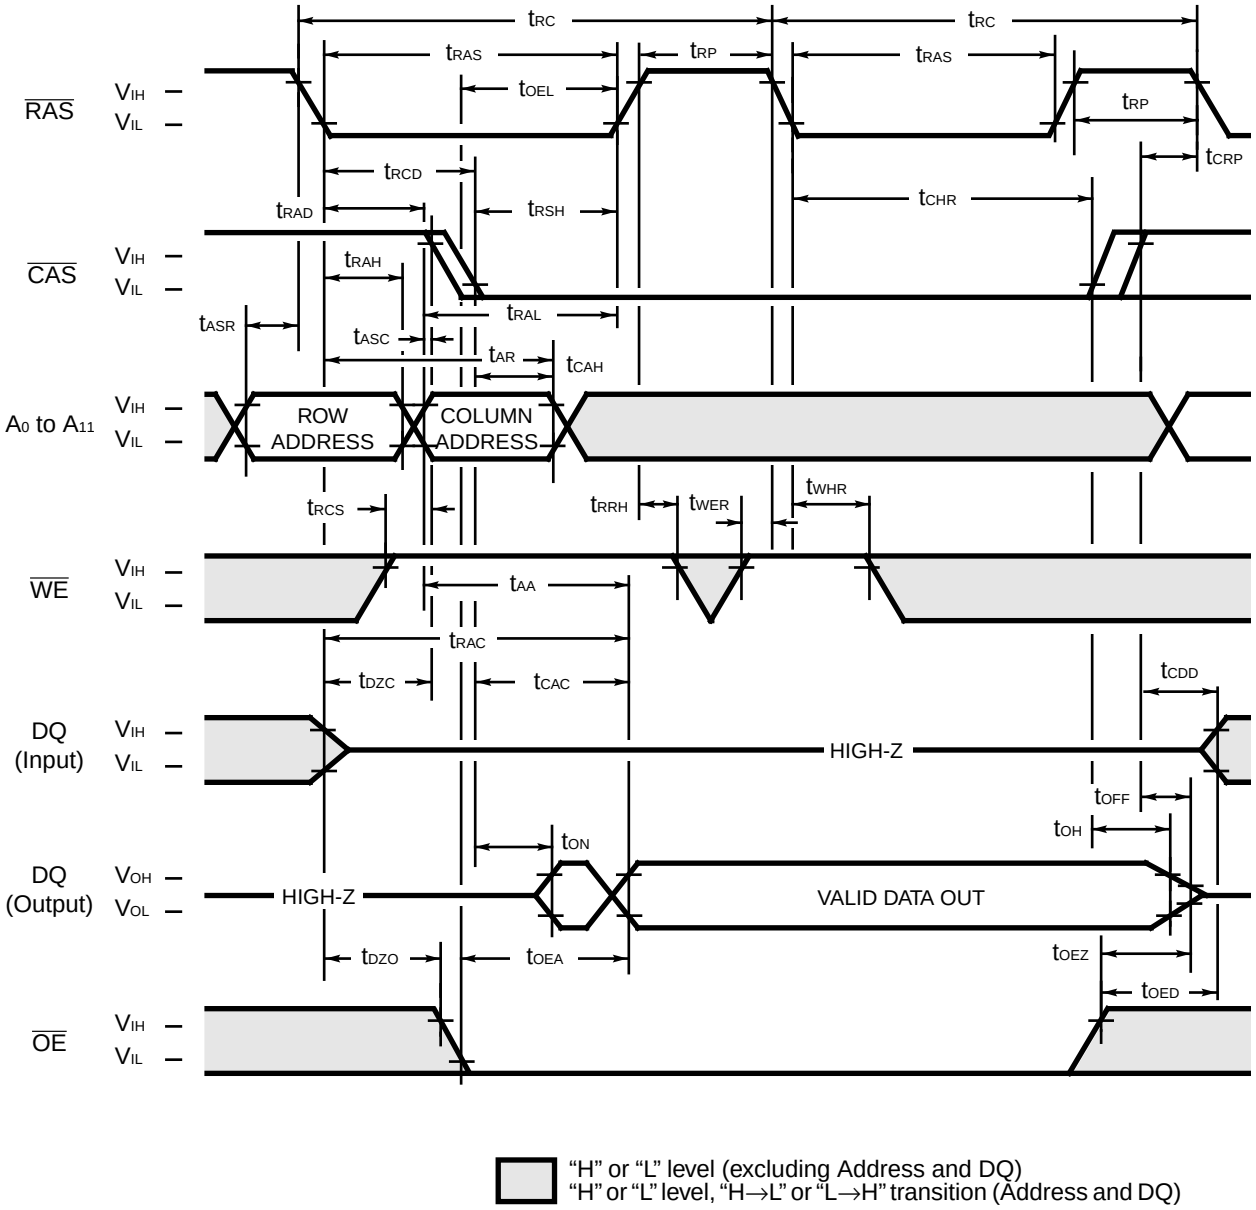
Fig. 14 – $\overline{CAS}$-BEFORE-$\overline{RAS}$ REFRESH (ADDRESSES = $\overline{OE}$ = "H" or "L")



DESCRIPTION

$\overline{CAS}$-before-$\overline{RAS}$ refresh is an on-chip refresh capability that eliminates the need for external refresh addresses. If $\overline{CAS}$ is held Low for the specified setup time (t_{CSR}) before $\overline{RAS}$ goes Low, the on-chip refresh control clock generators and refresh address counter are enabled. An internal refresh operation automatically occurs and the refresh address counter is internally incremented in preparation for the next $\overline{CAS}$-before-$\overline{RAS}$ refresh operation.

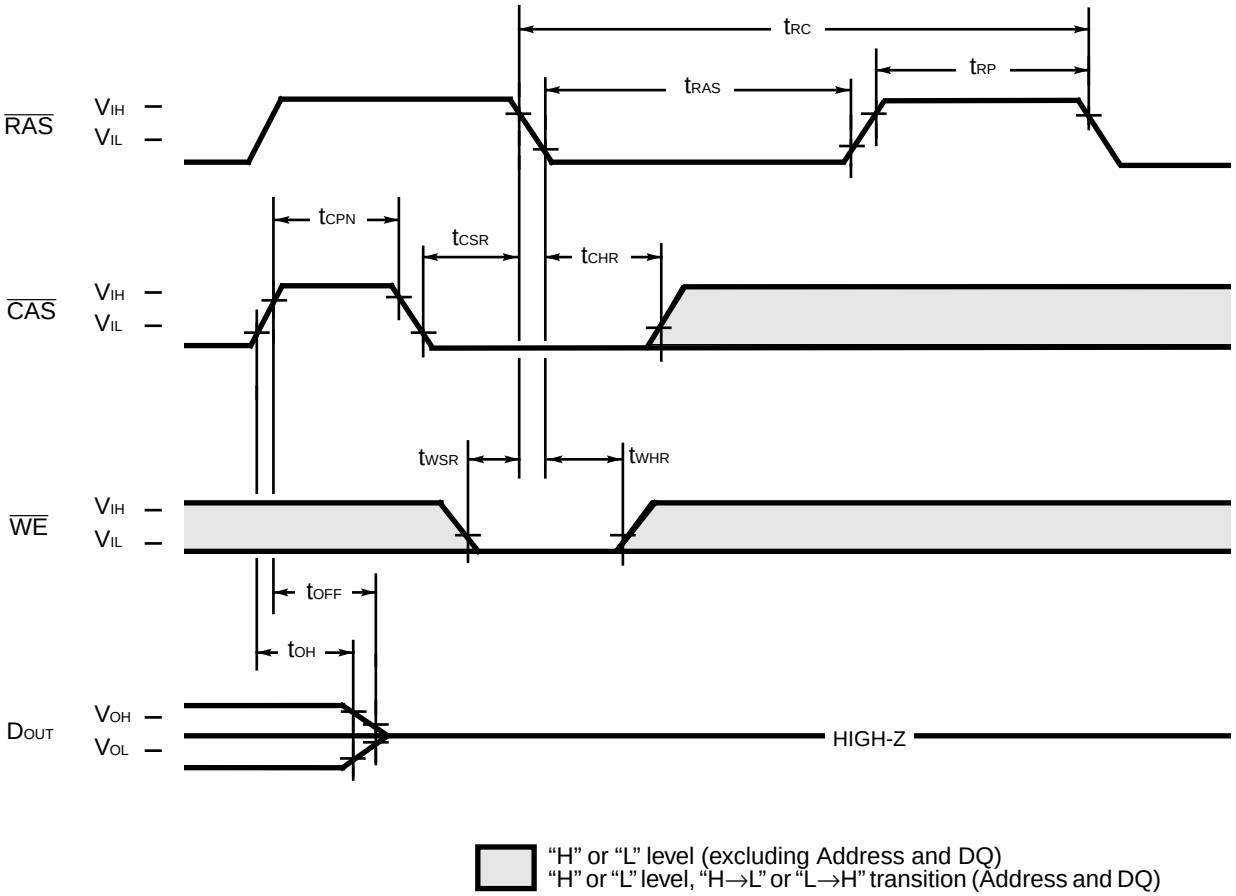
Fig. 15 – HIDDEN REFRESH CYCLE



DESCRIPTION

A hidden refresh cycle may be performed while maintaining the latest valid data at the output by extending the active time of $\overline{CAS}$ and cycling $\overline{RAS}$. The refresh row address is provided by the on-chip refresh address counter. This eliminates the need for the external row address that is required by DRAMs that do not have $\overline{CAS}$-before-$\overline{RAS}$ refresh capability.

Fig. 16 – TEST MODE SET CYCLE (A_0 to A_{11}, $\overline{OE}$ = "H" or "L")



DESCRIPTION

Test Mode;

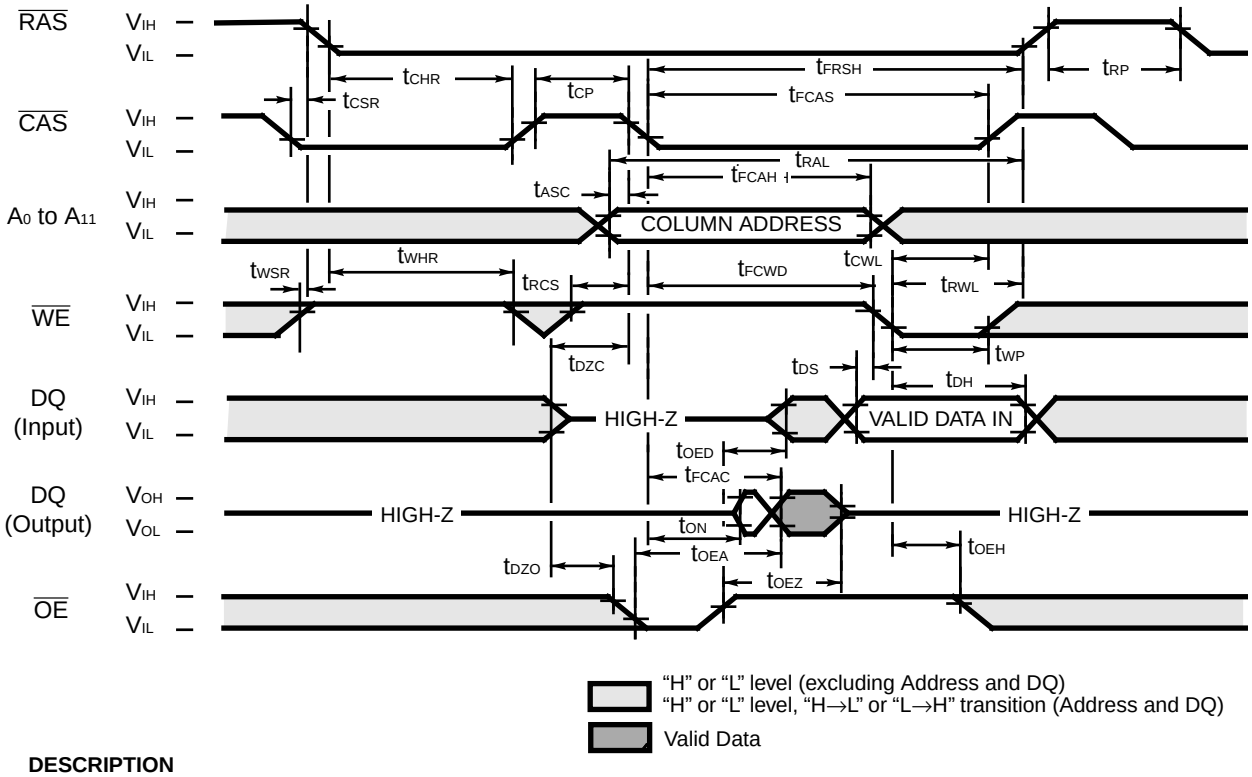
The purpose of this test mode is to reduce device test time to one sixteenth of that required to test the device conventionally.
The test mode function is entered by performing a $\overline{WE}$ and $\overline{CAS}$-before-$\overline{RAS}$ (WCBR) refresh for the entry cycle.
In the test mode, read and write operations are executed in units of sixteenth bits which are selected by the address combination of CA_0 and CA_1. In the write mode, data is written into sixteenth cells simultaneously. But the data must be input from DQ_1 only. In the read mode, the data of sixteenth cells at the selected addresses are read out from DQ and checked in the following manner.

When the sixteenth bits are all "L" or all "H", a "H" level is output.
When the sixteenth bits show a combination of "L" and "H", a "L" level is output.

The test mode function is exited by performing a $\overline{RAS}$-only refresh or a $\overline{CAS}$-before-$\overline{RAS}$ refresh for the exit cycle.
In test mode operation, the following parameters are delayed approximately 10 ns from the specified value in the data sheet.

t_{RC}, t_{RWC}, t_{RAC}, t_{CAC}, t_{AA}, t_{RAS}, t_{RSH}, t_{CAS}, t_{CSH}, t_{RAL}, t_{CAL}, t_{RWD}, t_{CWD}, t_{AWD}, t_{CPWD}, t_{RHCP}

Fig. 17 – $\overline{CAS}$-BEFORE-$\overline{RAS}$ REFRESH COUNTER TEST CYCLE



DESCRIPTION

A special timing sequence using the $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test cycle provides a convenient method to verify the functionality of $\overline{CAS}$-before-$\overline{RAS}$ refresh circuitry. If, after a $\overline{CAS}$-before-$\overline{RAS}$ refresh cycle $\overline{CAS}$ makes a transition from High to Low while $\overline{RAS}$ is held Low, read and write operations are enabled as shown above. Row and column addresses are defined as follows:

Row Address: Bits A_0 through A_{11} are defined by the on-chip refresh counter.
Column Address: Bits A_0 through A_{11} are defined by latching levels on A_0 to A_{11} at the second falling edge of $\overline{CAS}$.

The $\overline{CAS}$-before-$\overline{RAS}$ Counter Test procedure is as follows ;

1) Initialize the internal refresh address counter by using 8 $\overline{RAS}$ only refresh cycles.
2) Use the same column address throughout the test.
3) Write "0" to all 4096 row addresses at the same column address by using normal write cycles.
4) Read "0" written in procedure 3) and check; simultaneously write "1" to the same addresses by using $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test (read-modify-write cycles). Repeat this procedure 4096 times with addresses generated by the internal refresh address counter.
5) Read and check data written in procedure 4) by using normal read cycle for all 4096 memory locations.
6) Reverse test data and repeat procedures 3), 4), and 5).

(At recommended operating conditions unless otherwise noted.)

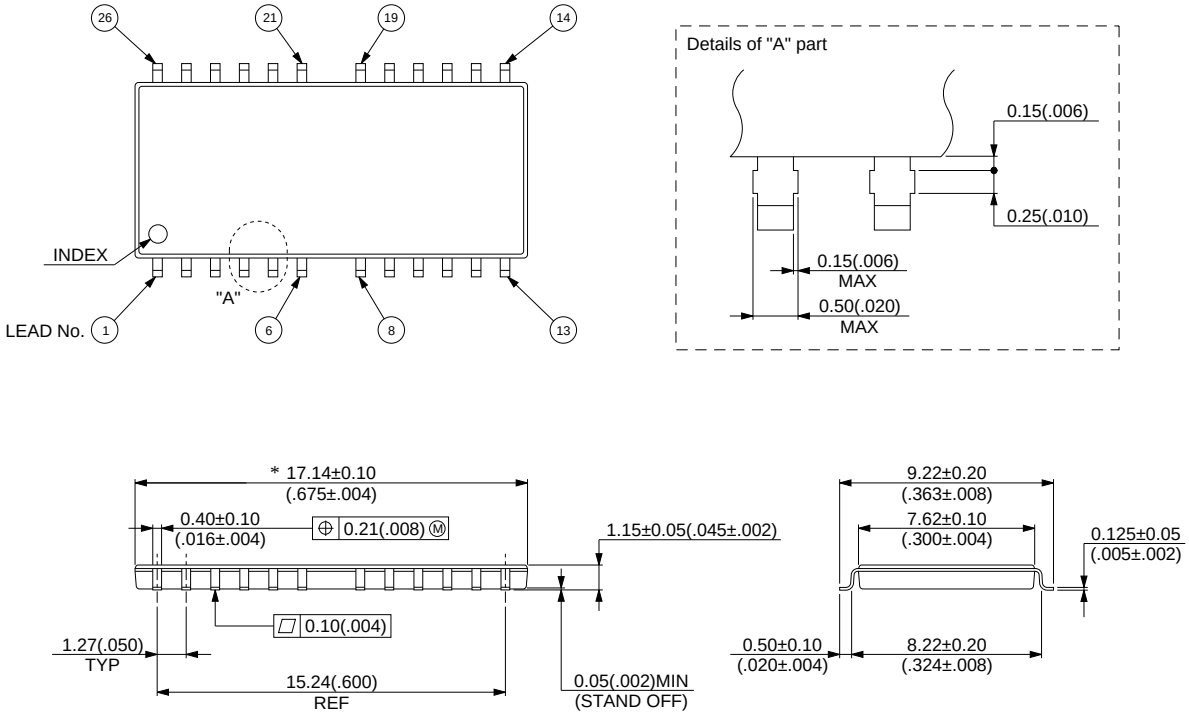
No.	Parameter	Symbol	MB81V16400B-60		MB81V16400B-60		Unit
			Min.	Max.	Min.	Max.	
90	Access Time from $\overline{CAS}$	t_{FCAC}	—	45	—	50	ns
91	Column Address Hold Time	t_{FCAH}	35	—	35	—	ns
92	$\overline{CAS}$ to $\overline{WE}$ Delay Time	t_{FCWD}	63	—	70	—	ns
93	$\overline{CAS}$ Pulse Width	t_{FCAS}	45	—	50	—	ns
94	$\overline{RAS}$ Hold Time	t_{FRSH}	45	—	50	—	ns

Note: Assumes that $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test cycle only.

■ PACKAGE DIMENSIONS

28-LEAD PLASTIC FLAT PACKAGE
(CASE No.: FPT-26P-M05)

* This dimension includes resin protrusion. (Each side: 0.15 (.006) MAX)

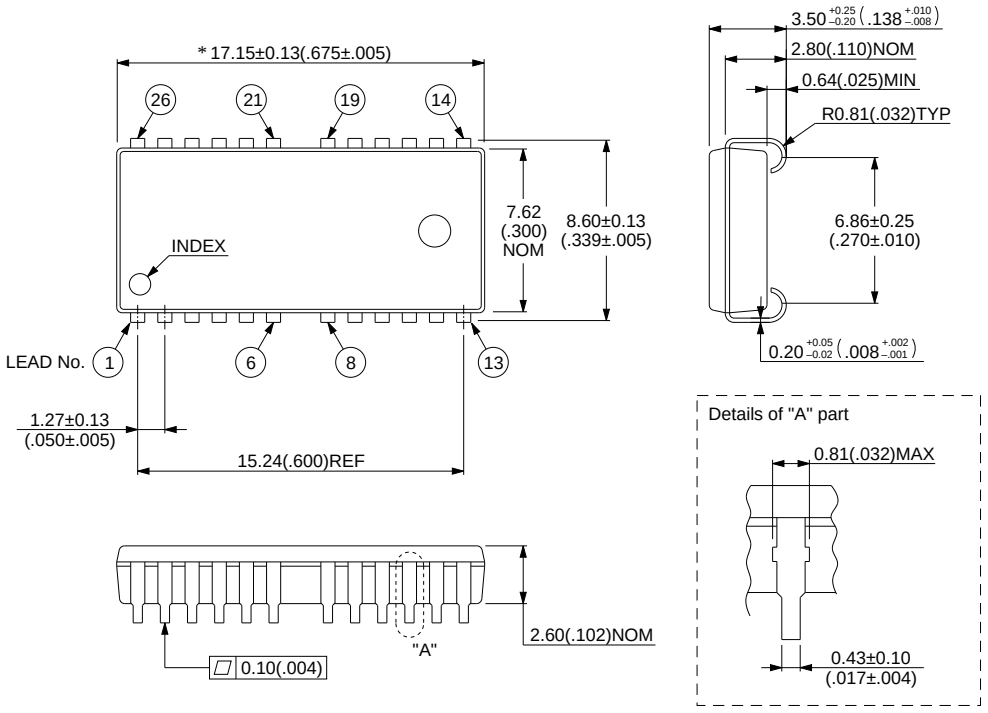


Dimensions in mm (inches)

■ PACKAGE DIMENSIONS

28-LEAD PLASTIC LEADED CHIP CARRIER
(CASE No.: LCC-26P-M09)

* This dimension includes resin protrusion. (Each side: 0.15 (.006) MAX)



Dimensions in mm (inches)

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).
CAUTION:
Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
