

Features

- Low Power CMOS Operation
 - 100 μ A max. Standby
 - 30 mA max. Active at 5 MHz
- Fast Read Access Time - 150ns
- JEDEC Standard Packages
 - 40-Lead 600 mil OTP Plastic DIP
 - 44-Pad OTP PLCC
- 5V $\pm$ 10% Supply
- High Reliability CMOS Technology
 - 2000V ESD Protection
 - 200mA Latchup Immunity
- Rapid Programming - 100 μ s/word (typical)
- Two-line Control
- CMOS and TTL Compatible Inputs and Outputs
- Integrated Product Identification Code
- Commercial and Industrial Temperature Ranges

Description

The AT32C16 chip is a low-power, high-performance One Time Programmable (OTP) Read Only Memory (PROM) organized 32K x 16. It requires only one 5V power supply in normal read mode operation. Any word can be accessed in less than 150ns, eliminating the need for speed reducing WAIT states. The by-16 organization makes these parts ideal for high-performance 16 and 32 bit microprocessor systems.

The AT32C16 is ideal for replacing the two 256K EPROMs normally used on personal computer motherboards.

Pin Configurations

Pin Name	Function
A0-A14	Addresses
O0-O15	Outputs
CE	Chip Enable
OE	Output Enable
PGM	Program Strobe
NC	No Connect

Note: Both GND pins must be connected.

Note: PLCC Package Pins 1 and 23 are DON'T CONNECT.

Preliminary

Description (Continued)

The AT32C16 comes in a choice of industry standard JEDEC-approved packages including; 40-pin DIP one time programmable (OTP) plastic or OTP plastic J-leaded chip carrier (PLCC). All devices feature two line control ($\overline{CE}$, $\overline{OE}$) to give designers the flexibility to prevent bus contention.

With high density 32K word storage capability, the AT32C16 allow firmware to be stored reliably and to be accessed by the system without the delays of mass storage media.

Atmel's 32C16 have additional features to ensure high quality and efficient production use. The Rapid Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 μ s/word. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages.

Absolute Maximum Ratings*

Temperature Under Bias	-55°C to +125°C
Storage Temperature	-65°C to +150°C
Voltage on Any Pin with Respect to Ground.....	-2.0V to +7.0V ⁽¹⁾
Voltage on A9 with Respect to Ground	-2.0V to +14.0V ⁽¹⁾
V _{PP} Supply Voltage with Respect to Ground.....	-2.0V to +14.0V ⁽¹⁾

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

1. Minimum voltage is -0.6V dc which may undershoot to -2.0V for pulses of less than 20ns. Maximum output pin voltage is V_{CC}+0.75V dc which may overshoot to +7.0V for pulses of less than 20ns.

- Notes:
1. X can be V_{IL} or V_{IH}.
 2. Refer to Programming characteristics.
 3. V_{IH} = 12.0 $\pm$ 0.5V.
 4. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_{IH}

5. Standby V_{CC} current (I_{SB}) is specified with V_{PP}=V_{CC}. V_{CC} > V_{PP} will cause a slight increase in I_{SB}.

A.C. Waveforms for Read Operation ⁽¹⁾

Notes:

1. Timing measurement references are 0.8V and 2.0V. Input AC driving levels are 0.45V and 2.4V, unless otherwise specified.
2. OE may be delayed up to t_{CE-tOE} after the falling edge of CE without impact on t_{CE} .
3. OE may be delayed up to $t_{ACC-tOE}$ after the address is valid without impact on t_{ACC} .
4. This parameter is only sampled and is not 100% tested.
5. Output float is defined as the point when data is no longer driven.

Programming Waveforms ⁽¹⁾

Notes:

1. The Input Timing Reference is 0.8V for VIL and 2.0V for VIH.
2. tOE and tDFP are characteristics of the device but must be accommodated by the programmer.
3. When programming the AT32C16 a 0.1μF capacitor is required across Vpp and ground to suppress spurious voltage transients.

Rapid Programming Algorithm

A 100 μs PGM pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5V and V_{PP} is raised to 13.0V. Each address is first programmed with one 100 μs PGM pulse without verification. Then a verification / reprogramming loop is executed for each address. In the event a word fails to pass verification, up to 10 successive 100 μs pulses are applied with a verification after each pulse. If the word fails to verify after 10 pulses have been applied, the part is considered failed. After the word verifies properly, the next address is selected until all have been checked. V_{PP} is then lowered to 5.0V and V_{CC} to 5.0V. All words are read again and compared with the original data to determine if the device passes or fails.
