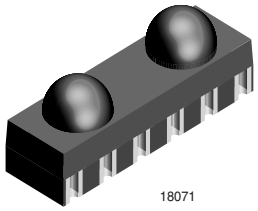
Serial Infrared Transceiver SIR, 115.2 kbit/s, 2.7 V to 5.5 V Operation

Description

The TFBS4710 is a low profile, full range Infrared Data Transceiver module. It supports IrDA data rates up to 115.2 kbit/s (SIR). The transceiver module consists of a photo PIN photodiode, an infrared emitter (IRED), and a low-power CMOS control IC to provide a total front-end solution in a single package.

The device has a link distance of 1 meter. The Rxd pulse width is independent of the duration of Txd pulse and always stays at a fixed width thus making the device optimum for all standard SIR Encoder/ Decoder and interfaces. The Shut Down (SD) feature cuts current consumption to typically 10 nA.



Features

- Compliant with the latest IrDA physical layer specification (9.6 kbit/s to 115.2 kbit/s)
- Small package:
  H 2.74 mm x D 3.33 mm x L 8.96 mm
- Typical Link distance 1 m
- Drop in replacement for IRM5000D/ IRMT5000
- Battery & Power Management Features:
  > Idle Current - 75 μA Typical
  > Shutdown Current - 10 nA Typical
  > Operates from 2.4 V - 5.0 V within specification over full temperature range from - 25 °C to + 85 °C
- Remote Control - transmit distance up to 8 meters
- Tri-State Receiver Output, floating in shutdown with a weak pull-up
- Fixed Rxd output pulse width (2 μs typical)
- Meets IrFM Fast Connection requirements
- Split power supply, an independant, unregulated supply for IRED Anode and a well regulated supply for V_{CC}
- Directly Interfaces with Various Super I/O and Controller Devices and Encoder/ Decoder such as TOIM4232.

Applications

- Ideal for Battery Operated Devices
- PDAs
- Mobile Phones
- Electronic Wallet (IrFM)
- Notebook Computers
- Digital Still and Video Cameras
- Printers, Fax Machines, Photocopiers, Screen Projectors
- Data Loggers
- External Infrared Adapters (Dongles)
- Diagnostics Systems
- Medical and Industrial Data Collection Devices

Definitions:

In the Vishay transceiver data sheets the following nomenclature is used for defining the IrDA operating modes:

SIR: 2.4 kbit/s to 115.2 kbit/s, equivalent to the basic serial infrared standard with the physical layer version IrPhy 1.0

MIR: 576 kbit/s to 1152 kbit/s
FIR: 4 Mbit/s
VFIR: 16 Mbit/s

MIR and FIR were implemented with IrPhy 1.1, followed by IrPhy 1.2, adding the SIR Low Power Standard. IrPhy 1.3 extended the Low Power Option to MIR and FIR and VFIR was added with IrPhy 1.4.A new version of the standard in any case obsoletes the former version.

With introducing the updated versions the old versions are obsolete. Therefore the only valid IrDA standard is the actual version IrPhy 1.4 (in Oct. 2002).

Pin Description

Pin Number	Function	Description	I/O	Active
1	IRED Anode	IRED Anode is connected to a power supply. The LED current can be decreased by adding a resistor in series between the power supply and IRED Anode. A separate unregulated power supply can be used at this pin.		
2	Txd	This Input is used to turn on IRED transmitter when SD is low. An on-chip protection circuit disables the LED driver if the Txd pin is asserted for longer than 80 µs	I	HIGH
3	Rxd	Received Data Output, normally stays high but goes low for a fixed duration during received pulses. It is capable of driving a standard CMOS or TTL load.	O	LOW
4	SD	Shutdown. Setting this pin active for more than 1.5 ms switches the device into shutdown mode	I	HIGH
5	V_{CC}	Regulated Supply Voltage		
6	GND	Ground

Recommended Circuit Diagram

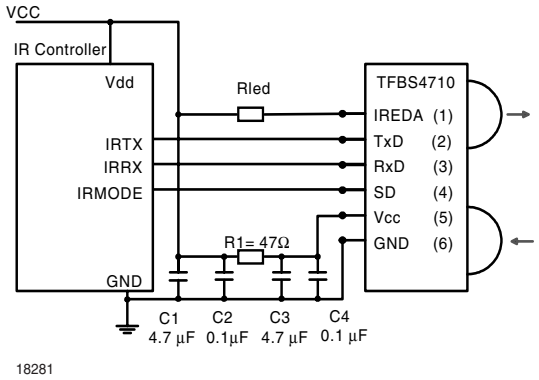

Figure 1. Recommended Application Circuit

The TFBS4710 integrates a sensitive receiver and a built-in power driver. This combination needs a careful circuit layout. The use of thin, long, resistive and inductive wiring should be avoided. The inputs (Txd, SD) and the output (Rxd) should be directly (DC) coupled to the I/O circuit.

The combination of resistor R1 and capacitors C1, C2, C3 and C4 filter out any power supply noise to provide a smooth supply voltage.

The placement of these components is critical. It is strongly recommended to position C3 and C4 as close as possible to the transceiver power supply pins. A Tantalum capacitor should be used for C1 and C3 while a ceramic capacitor should be used for C2 and C4.

A current limiting resistor is not needed for normal operation. It is strongly recommended to use the Rled values mentioned in Table 1 below for high temperature operation. For Low Power Mode, IRED Anode voltage of less than 5 V is recommended.

Under extreme EMI conditions as placing a RF - transmitter antenna on top of the transceiver, it is recommended to protect all inputs by a low-pass filter, as a minimum a 12 pF capacitor, especially at the Rxd port.

Basic RF design rules for circuit design should be followed. Especially longer signal lines should not be used without proper termination. For reference see "The Art of Electronics" by Paul Horowitz, Winfield Hill, 1989, Cambridge University Press, ISBN: 0521370957.

Ozone Depleting Substances Policy Statement

It is the policy of **Vishay Semiconductor GmbH** to

1. Meet all present and future national and international statutory requirements.
2. Regularly and continuously improve the performance of our products, processes, distribution and operatingsystems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.

It is particular concern to control or eliminate releases of those substances into the atmosphere which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) intend to severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

Vishay Semiconductor GmbH has been able to use its policy of continuous improvements to eliminate the use of ODSs listed in the following documents.

1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively
2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA
3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

Vishay Semiconductor GmbH can certify that our semiconductors are not manufactured with ozone depleting substances and do not contain such substances.
