MX27L1000

1M-BIT [128Kx8] LOW VOLTAGE OPERATION CMOS EPROM

FEATURES

- 128K x 8 organization
- Wide power supply range, 2.7V DC to 3.6VDC
- +12.5V programming voltage
- Fast access time:90/120/150/200/250 ns
- Totally static operation
- Completely TTL compatible
- Operating current: 20mA @3.6V, 5MHz
- Standby current: 10uA
- Package type:
  - 32 pin plastic DIP
  - 32 pin SOP
  - 32 pin TSOP
  - 32 pin PLCC

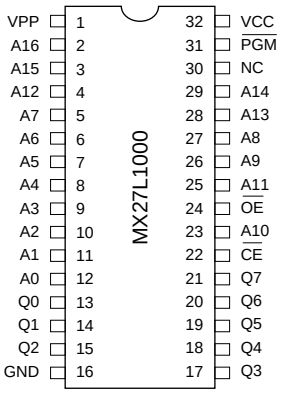
GENERAL DESCRIPTION

The MX27L1000 is a 1M-bit, One Time Programmable Read Only Memory. It isorganized as 128K words by 8 bits per word, opeates from a single 2.7 to 3.6 volt supply, has a static standby mode, and features fast single address location programming. All programming signals are TTL levels, requirin a single pulse. For programming outside from the system, existing EPROM programmers may be used. The MX27L1000 supports a intelligent fast programming algorithm which can result in programming time of less than thirty seconds.

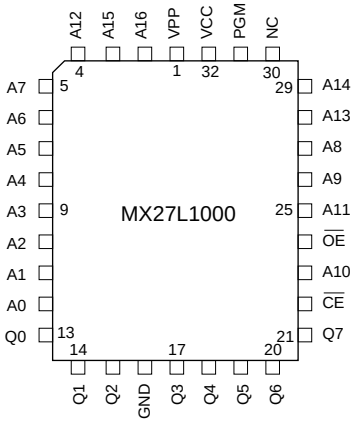
This EPROM is packaged in industry standard 32 pin dual-in-line packages,32 lead SOP , 32 lead PLCC, and 32 lead TSOP packages.

PIN CONFIGURATIONS

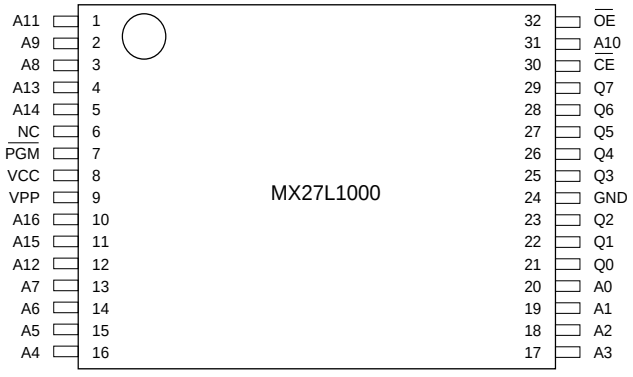
32 PDIP/SOP



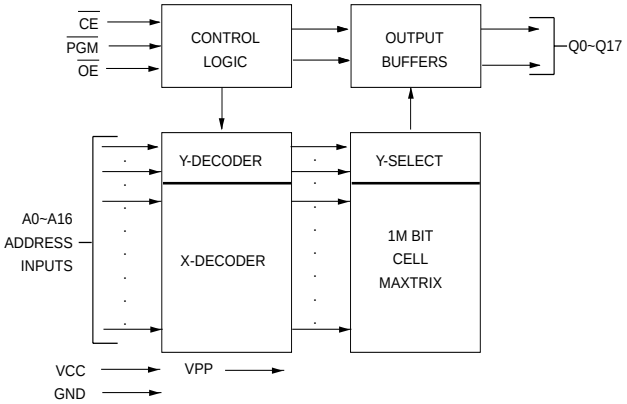
32 PLCC



32 TSOP



BLOCK DIAGRAM



PIN DESCRIPTION

SYMBOL	PIN NAME
A0~A16	Address Input
Q0~Q7	Data Input/Output
$\overline{CE}$	Chip Enable Input
$\overline{OE}$	Output Enable Input
$\overline{PGM}$	Programmable Enable Input
VPP	Program Supply Voltage
NC	No Internal Connection
VCC	Power Supply Pin
GND	Ground Pin

FUNCTIONAL DESCRIPTION

THE PROGRAMMING OF THE MX27L1000

When the MX27L1000 is delivered, or it is erased, the chip has all 1M bits in the "ONE" or HIGH state. "ZERO" are loaded into the MX27L1000 through the procedure of programming.

For programming, the data to be programmed is applied with 8 bits in parallel to the data pins.

VCC must be applied simultaneously or before VPP, and removed simultaneously or after VPP. When programming an MXIC EPROM, a 0.1uF capacitor is required across VPP and ground to suppress spurious voltage transients which may damage the device.

FAST PROGRAMMING

The device is set up in the fast programming mode when the programming voltage VPP = 12.75V is applied, with VCC = 6.25 V and $\overline{PGM}$ = VIL(or $\overline{OE}$ = VIH) (Algorithm is shown in Figure 1). The programming is achieved by applying a single TTL low level 100us pulse to the $\overline{PGM}$ input after addresses and data line are stable. If the data is not verified, an additional pulse is applied for a maximum of 25 pulses. This process is repeated while sequencing through each address of the device. When the programming mode is completed, the data in all address is verified at VCC = VPP = 5V ± 10%.

PROGRAM INHIBIT MODE

Programming of multiple MX27L1000s in parallel with different data is also easily accomplished by using the Program Inhibit Mode. Except for $\overline{CE}$ and $\overline{OE}$, all like inputs of the parallel MX27L1000 may be common. A TTL low-level program pulse applied to an MX27L1000 $\overline{CE}$ input with VPP = 12.5 ± 0.5 V and $\overline{PGM}$ LOW will program that MX27L1000. A high-level $\overline{CE}$ input inhibits the other MX27L1000s from being programmed.

PROGRAM VERIFY MODE

Verification should be performed on the programmed bits to determine that they were correctly programmed. The verification should be performed with $\overline{OE}$ and $\overline{CE}$ at VIL, $\overline{PGM}$ at VIH, and VPP at its programming voltage.

AUTO IDENTIFY MODE

The auto identify mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and device type. This mode is intended for use by programming equipment for the purpose of automatically matching the device to be programmed with its corresponding programming algorithm. This mode is functional in the 25℃ ± 5℃ ambient temperature range that is required when programming the MX27L1000.

To activate this mode, the programming equipment must force 12.0 ± 0.5 V on address line A9 of the device. Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from VIL to VIH. All other address lines must be held at VIL during auto identify mode.

Byte 0 (A0 = VIL) represents the manufacturer code, and byte 1 (A0 = VIH), the device identifier code. For the MX27L1000, these two identifier bytes are given in the Mode Select Table. All identifiers for manufacturer and device codes will possess odd parity, with the MSB (Q7) defined as the parity bit.

READ MODE

The MX27L1000 has two control functions, both of which must be logically satisfied in order to obtain data at the outputs. Chip Enable ($\overline{CE}$) is the power control and should be used for device selection. Output Enable ($\overline{OE}$) is the output control and should be used to gate data to the output pins, independent of device selection. Assuming that addresses are stable, address access time (tACC) is equal to the delay from $\overline{CE}$ to output (tCE). Data is available at the outputs tQE after the falling edge of $\overline{OE}$, assuming that $\overline{CE}$ has been LOW and addresses have been stable for at least tACC - tOE.

STANDBY MODE

The MX27L1000 has a CMOS standby mode which reduces the maximum VCC current to 10 uA. It is placed in CMOS standby when $\overline{CE}$ is at VCC ± 0.3 V. The MX27L1000 also has a TTL-standby mode which reduces the maximum VCC current to 0.25mA. It is placed in TTL-standby when $\overline{CE}$ is at VIH. When in standby mode, the outputs are in a high-impedance state, independent of the $\overline{OE}$ input.

TWO-LINE OUTPUT CONTROL FUNCTION

To accommodate multiple memory connections, a two-line control function is provided to allow for:

1. Low memory power dissipation,
2. Assurance that output bus contention will not occur.

It is recommended that $\overline{CE}$ be decoded and used as the primary device-selecting function, while $\overline{OE}$ be made a common connection to all devices in the array and connected to the READ line from the system control bus. This assures that all deselected memory devices are in their low-power standby mode and that the output pins are only active when data is desired from a particular memory device.

SYSTEM CONSIDERATIONS

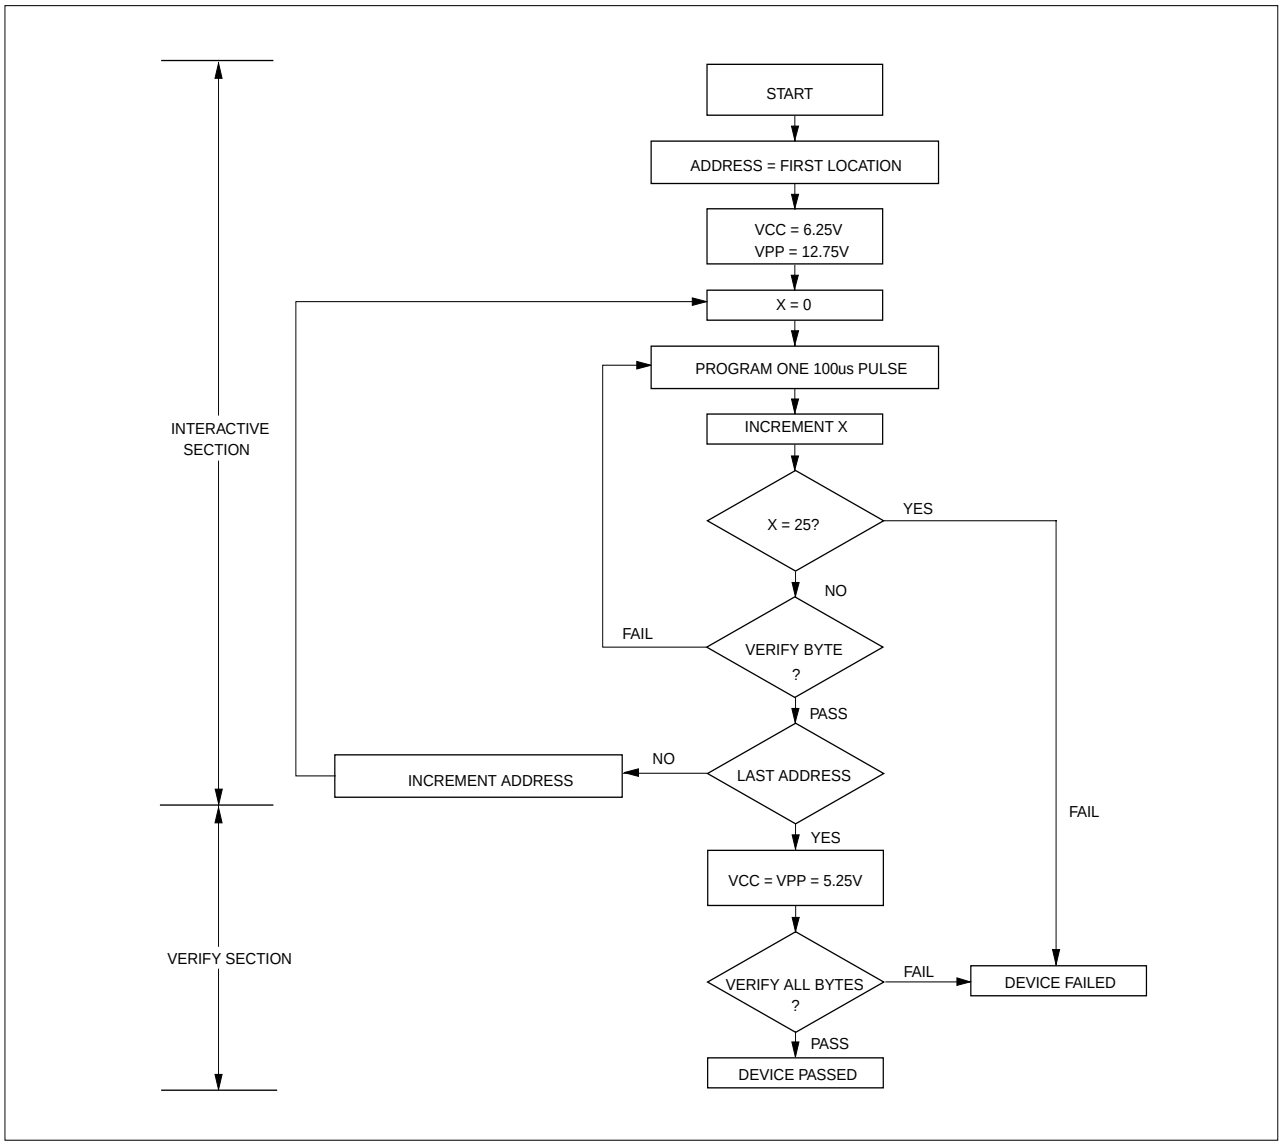
During the switch between active and standby conditions, transient current peaks are produced on the rising and falling edges of Chip Enable. The magnitude of these transient current peaks is dependent on the output capacitance loading of the device. At a minimum, a 0.1 uF ceramic capacitor (high frequency, low inherent inductance) should be used on each device between Vcc and GND to minimize transient effects. In addition, to overcome the voltage drop caused by the inductive effects of the printed circuit board traces on EPROM arrays, a 4.7 uF bulk electrolytic capacitor should be used between Vcc and GND for each eight devices. The location of the capacitor should be close to where the power supply is connected to the array.

MODE SELECT TABLE

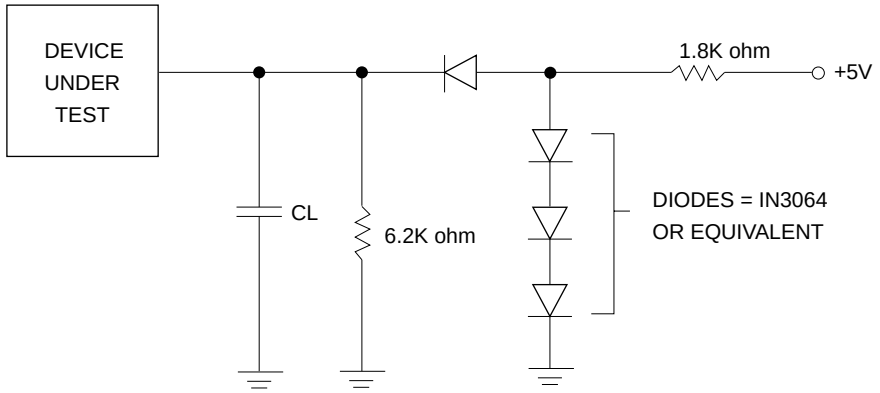
			PINS				
MODE	**$\overline{CE}$**	**$\overline{OE}$**	**$\overline{PGM}$**	**A0**	**A9**	**VPP**	**OUTPUTS**
Read	VIL	VIL	X	X	X	VCC	DOUT
Output Disable	VIL	VIH	X	X	X	VCC	High Z
Standby (TTL)	VIH	X	X	X	X	VCC	High Z
Standby (CMOS)	VCC ± 0.3V	X	X	X	X	VCC	High Z
Program	VIL	VIH	VIL	X	X	VPP	DIN
Program Verify	VIL	VIL	VIH	X	X	VPP	DOUT
Program Inhibit	VIH	X	X	X	X	VPP	High Z
Manufacturer Code(3)	VIL	VIL	X	VIL	VH	VCC	C2H
Device Code(3)	VIL	VIL	X	VIH	VH	VCC	0EH

NOTES:
1. VH = 12.0 V ± 0.5 V
2. X = Either VIH or VIL
3. A1 - A8 = A10 - A16 = VIL(For auto select)
4. See DC Programming Characteristics for VPP voltage during programming.

FIGURE 1. FAST PROGRAMMING FLOW CHART

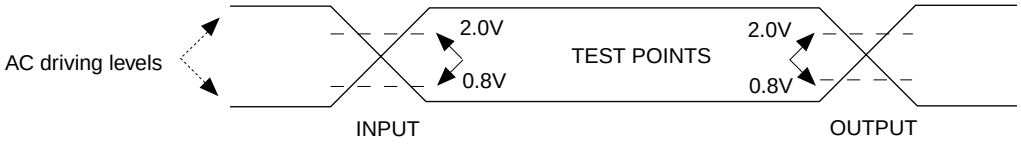


SWITCHING TEST CIRCUITS



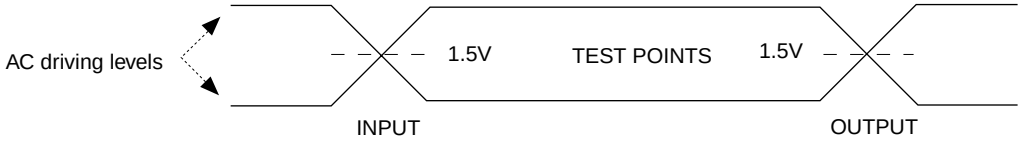
CL = 100 pF including jig capacitance
CL = 30 pF including jig capacitance for 90/120ns

SWITCHING TEST WAVEFORMS



AC TESTING: AC driving levels are 2.4V/0.4V for both commercial grade and industrial grade.
Input pulse rise and fall times are ≤ 10ns.

SWITCHING TEST WAVEFORMS (For Speed 90/120ns)



AC TESTING: AC driving levels are 3.0V/0V for both commercial grade and industrial grade.
Input pulse rise and fall times are ≤ 10ns.

ABSOLUTE MAXIMUM RATINGS

RATING	VALUE
Ambient Operating Temperature	-40°C to 85°C
Storage Temperature	-65°C to 125°C
Applied Input Voltage	-0.5V to 7.0V
Applied Output Voltage	-0.5V to VCC+0.5V
VCC to Ground Potential	-0.5V to 7.0V
V9 & VPP	-0.5V to 13.5V

NOTICE:
Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.

NOTICE:
Specifications contained within the following tables are subject to change.

DC/AC Operating Conditions for Read Operation

		MX27L1000
