

P10C68/P11C68

(Previously PNC10C68 and PNC11C68)

CMOS/SNOS NVSRAM

HIGH PERFORMANCE 8 K x 8 NON-VOLATILE STATIC RAM

(Supersedes DS3159-1.3, DS3160-1.3, DS3234-1.1, DS3235-1.1)

The P10C68 and P11C68 are fast static RAMs (35 and 45 ns) with a non-volatile electrically-erasable PROM (EEPROM) cell incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times while independent non-volatile data resides in PROM.

On the P10C68 data may easily be transferred from the SRAM to the EEPROM (STORE) and from the EEPROM back to the SRAM (RECALL) using the NE (bar) pin. The Store and Recall cycles are initiated through software sequences on the P11C68. These devices combine the high performance and ease of use of a fast SRAM with the data integrity of non-volatility.

The P10C68 and P11C68 feature the industry standard pinout for non-volatile RAMs in 28-pin 0.3-inch plastic and ceramic dual-in-line packages.

FEATURES

- Non-Volatile Data Integrity
- 10 year Data Retention in EEPROM
- 35ns and 45ns Address and Chip Enable Access Times
- 20ns and 25ns Output Enable Access
- Unlimited Read and Write to SRAM
- Unlimited Recall Cycles from EEPROM
- 10⁴ Store Cycles to EEPROM
- Automatic Recall on Power up
- Automatic Store Timing
- Hardware Store Protection
- Single 5V ± 10% Operation
- Available in Standard Package 28-pin 0.3-inch DIL plastic and ceramic
- Commercial and Industrial temperature ranges

ORDERING INFORMATION

(See back page)

Figure 1. Pin connections - top view.

Figure 2. Logic block diagram.

ABSOLUTE MAXIMUM RATINGS

Voltage on typical input relative to VSS	-0.6V to 7.0V
Voltage on DQ0-7 and G(bar)	-0.5V to (V _{CC} + 0.5V)
Temperature under Bias	-55°C to + 125°C
Storage temperature	-65°C to + 150°C
Power dissipation (ie limit of package)	1W
DC output current (one output at a time, one second duration)	15mA

NOTE

Stresses greater than those listed in the Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only; functional operation of the device at any other conditions than those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum ratings conditions for extended periods may affect reliability.

DC OPERATING CONDITIONS

Parameter	Symbol	Value			Units	Conditions
		Min.	Typ.	Max.		
Supply voltage	V _{CC}	4.5	5.0	5.5	V	
Input logic '1' voltage	V _{IH}	2.2		V _{CC} + 0.5	V	All inputs
Input logic '0' voltage	V _{IL}	V _{SS} - 0.5		0.8	V	All inputs
Ambient operating temperature commercial	T _{amb}	0		+70	°C	
industrial	T _{amb}	-40		+85	°C	

DC ELECTRICAL CHARACTERISTICS**Commercial temperature range**

Test conditions (unless otherwise stated):

T_{amb} = 0°C to 70°C, V_{CC} = +5V ± 10% (See notes 1, 2 and 3)

Characteristic	Symbol	Value		Units	Conditions
		Min.	Max.		
Average power supply current	I _{CC1}		75 65	mA mA	t _{AVAV} = 35ns t _{AVAV} = 45ns
Average power supply current during STORE cycle	I _{CC2}		50	mA	All inputs at V _{IN} ≤ 0.2V
Average power supply current (standby, cycling TTL input levels)	I _{SB1}		23 20	mA mA	t _{AVAV} = 35ns t _{AVAV} = 45ns E(bar) ≥ V _{IH} , all other inputs cycling
Average power supply current (standby, stable CMOS input levels)	I _{SB2}		1	mA	E (bar) ≥ (V _{CC} - 0.2V), all other inputs at V _{IN} ≤ 0.2V or ≥ (V _{CC} - 0.2V)
Input leakage current (any input)	I _{ILK}		±1	μA	V _{CC} = max, V _{IN} = V _{SS} to V _{CC}
Off state output leakage current	I _{OLK}		±5	μA	V _{CC} = max, V _{IN} = V _{SS} to V _{CC}
Output logic '1' voltage	V _{OH}	2.4		V	I _{OUT} = 4mA
Output voltage '0' voltage	V _{OL}		0.4	V	I _{OUT} = 8mA

NOTES

- I_{CC1} is dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded.
- Bringing E (bar) ≥ V_{IH} will not produce standby currents levels until any non-volatile cycle in progress has timed out. See Mode Selection table.
- I_{CC2} is the average current required for the duration of the STORE cycle (t_{STORE}) after the sequence that initiates the cycle.

Industrial temperature range

Test conditions (unless otherwise stated):

$T_{amb} = -40^{\circ}\text{C}$ to 85°C , $V_{CC} = +5\text{V} \pm 10\%$ (See notes 4, 5 and 6)

Characteristic	Symbol	Value		Units	Conditions
		Min.	Max.		
Average power supply current	I_{CC1}		80 75	mA mA	$t_{AVAV} = 35\text{ns}$ $t_{AVAV} = 45\text{ns}$
Average power supply current during STORE cycle	I_{CC2}		50	mA	All inputs at $V_{IN} \leq 0.2\text{V}$
Average power supply current (standby, cycling TTL input levels)	I_{SB1}		27 23	mA mA	$t_{AVAV} = 35\text{ns}$ $t_{AVAV} = 45\text{ns}$ $E(\text{bar}) \geq V_{IH}$, all other inputs cycling
Average power supply current (standby, stable CMOS input levels)	I_{SB2}		1	mA	$E(\text{bar}) \geq (V_{CC} - 0.2\text{V})$, all other inputs at $V_{IN} \leq 0.2\text{V}$ or $\geq (V_{CC} - 0.2\text{V})$
Input leakage current (any input)	I_{ILK}		± 1	μA	$V_{CC} = \text{max}$, $V_{IN} = V_{SS}$ to V_{CC}
Off state output leakage current	I_{OLK}		± 5	μA	$V_{CC} = \text{max}$, $V_{IN} = V_{SS}$ to V_{CC}
Output logic '1' voltage	V_{OH}	2.4		V	$I_{OUT} = 4\text{mA}$
Output voltage '0' voltage	V_{OL}		0.4	V	$I_{OUT} = 8\text{mA}$

NOTES

- I_{CC1} is dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded.
- Bringing $E(\text{bar}) \geq V_{IH}$ will not produce standby currents levels until any non-volatile cycle in progress has timed out. See Mode Selection table.
- I_{CC2} is the average current required for the duration of the STORE cycle (t_{STORE}) after the sequence that initiates the cycle.

AC TEST CONDITIONS

Input pulse levels	V_{SS} to 3V
Input rise and fall times	$\leq 5\text{ns}$
Input and output timing reference levels	1.5V
Output load	See Figure 3

CAPACITANCE $T_{amb} = 25^{\circ}\text{C}$, $f = 1.0\text{MHz}$ (see note 7)

Parameter	Symbol	Max.	Units	Conditions
Input capacitance	C_{IN}	5	pF	$\Delta V = 0$ to 3V
Output capacitance	C_{OUT}	7	pF	$\Delta V = 0$ to 3V

NOTE

7. These parameters are characterised but not 100% tested.

Figure 3. AC output loading.

SRAM MEMORY OPERATION

Test conditions (unless otherwise stated): Commercial and Industrial Temperature Range

 $V_{CC} = +5V \pm 10\%$

NOTES

8. E (bar), G (bar) and W (bar) must make the transition between $V_{IH}(\text{min})$ to $V_{IL}(\text{max})$, or $V_{IL}(\text{max})$ to $V_{IH}(\text{min})$ in a monotonic fashion. NE (bar) must be $\geq V_{IH}$ during entire cycle.
9. For READ CYCLE 1 and 2, W (bar) and NE (bar) must be high for entire cycle.
10. Device is continuously selected with E (bar) low, and G (bar) low.
11. Measured $\pm 200\text{mV}$ from steady state output voltage. Load capacitance is 5pF.
12. Parameter guaranteed but not tested.

Figure 4. READ CYCLE 1 timing diagram (see notes 9 and 10).

Figure 5. READ CYCLE 2 timing diagram (see note 9).

WRITE CYCLE 1 : W (BAR) CONTROLLED (See notes 8 and 13)

Symbol		Parameter	P10C68-35 P11C68-35		P10C68-45 P11C68-45		Units	Notes
Standard	Alternative		Min.	Max.	Min.	Max.		
tAVAV1	tWC	Write cycle time	35		45		ns	15

t _{WLNH}		Write low to $\overline{NE}$ (bar) rise	45		45		ns	19
t _{ELWL}		Chip enable set-up	0		0		ns	

STORE CYCLE 2 : E (BAR) CONTROLLED (See note 17)

Symbol		Parameter	P10C68-35		P10C68-45		Units	Notes
Standard	Alternative		Min.	Max.	Min.	Max.		
t_{ELQX1}	t_{STORE}	Store cycle time		10		10	ms	18
t_{NLEL}		NE (bar) set-up to chip enable	0		0		ns	
t_{WLEL}		Write enable set-up to chip enable	0		0		ns	
t_{ELNH}	t_{WC}	Chip enable to NE (bar) rise	45		45		ns	19
t_{GHLE}		Output disable set-up to E (bar) fall	0		0		ns	

NOTES

- E (bar), G (bar), NE (bar) and W (bar) must make the transition between VIH(min) to VIL(max), or VIL(max) to VIH(min) in a monotonic fashion.
- Measured with W (bar) and NE (bar) both returned high, and G (bar) returned low. Note that store cycles are inhibited/aborted by $V_{CC} < 3.3V$ (STORE inhibit).
- Once t_{WC} has been satisfied by NE (bar), G (bar), W (bar) and E (bar) the store cycle is completed automatically, ignoring all inputs. Any of NE (bar), G (bar), W (bar) or E (bar) may be used to terminate the store initiation cycle.

Figure 9. STORE CYCLE 1: W (bar) controlled timing diagram (see note 17).

Figure 10. STORE CYCLE 2: E (bar) controlled timing diagram (see note 17).

		1555	Read RAM	Output Data		22, 23
		0AAA	Read RAM	Output Data		22, 23
		1FFF	Read RAM	Output Data		22, 23
		10F0	Read RAM	Output Data		22, 23
		0F0E	Non-volatile RECALL	Output High Z		22

NOTES

22. The six consecutive addresses must be in order listed - (0000, 1555, 0AAA, 1FFF, 10F0, 0F0F) for a STORE cycle or (0000, 1555, 0AAA, 1FFF, 10F0, 0F0E) for a RECALL cycle. W (bar) must be high during all six consecutive cycles. See STORE CYCLE and RECALL CYCLE tables and diagrams for further details.
23. I/O state assumes that G (bar) $\geq V_{IL}$. Activation of non-volatile cycles does not depend on the state of G (bar).

STORE / RECALL CYCLES 1 AND 2 (See notes 25 and 30)

Symbol		Parameter	P11C68-35		P11C68-45		Units	Notes
Standard	Alternative		Min.	Max.	Min.	Max.		
t _{AVAV}	t _{ACS}	Read cycle time	35		45		ns	
t _{AXAV}	t _{SKEW}	Skew between sequentially adjacent addresses		5		5	ns	24
t _{AVQZ}	t _{ELQZ}	Address valid to output inactive		75		75	ns	26
	t _{STORE}	Store cycle time		10		10	ms	27
	t _{RECALL}	Recall cycle time		20		20	μs	27
t _{AVEL}	t _{AE}	Address set-up to chip enable	0		0		ns	28
t _{ELEH}	t _{EP}	Chip enable pulse width	35		45		ns	28
t _{EHAX}	t _{EA}	Chip disable to address change	0		0		ns	28

NOTES

24. Skew spec may be avoided by using E (bar) (STORE/RECALL CYCLE 2).
25. W (bar) $\geq V_{IH}$ during entire address sequence to initiate a non-volatile cycle. Required address sequences are shown in the Mode Selection table.
26. Once the software STORE or RECALL cycle is initiated, it completes automatically, ignoring all inputs.
27. Measured with W (bar) high, G (bar) low and E (bar) low. Note that STORE cycles (but not RECALLS) are aborted by $V_{CC} < 3.3V$ (STORE Inhibit).
28. E (bar) must make the transition between $V_{IH}(\max)$ to $V_{IL}(\max)$, or $V_{IL}(\max)$ to $V_{IH}(\min)$ in a monotonic fashion.
29. Chip is continuously selected with E (bar) low.
30. Addresses 1 through 6 are found in the Mode Selection table. Address 6 determines whether the P11C68 performs a STORE or RECALL. A RECALL cycle is performed automatically at power up when V_{CC} exceeds 3.3V. V_{CC} must not drop below 3.3V once it has exceeded it for the RECALL to function properly. t_{RECALL} is measured from the point at which V_{CC} exceeds 3.3V.

Figure 14. STORE/RECALL cycle 1. Address controlled timing diagram (see notes 23, 27 and 28).

Figure 15. STORE/RECALL cycle 2. E (bar) controlled timing diagram (see notes 23, 26 and 28).

OPERATING NOTES

Note: References to NE (bar) should be taken as applying to P10C68 only and can be ignored for P11C68.

The devices have two separate modes of operation: SRAM mode and non-volatile mode. In SRAM mode, the memory operates as an ordinary static RAM. While in non-volatile mode, data is transferred in parallel from SRAM to EEPROM or from EEPROM to SRAM.

SRAM READ

The devices perform a read cycle when ever E (bar) and G (bar) are LOW and NE (bar) and W (bar) are HIGH. The address specified by the thirteen address pins A_{0-12} determine which of the 8192 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of t_{AVQV} (READ CYCLE 1).

If the READ is initiated by E (bar) or G (bar), the outputs will be valid at t_{ELQV} or t_{GLQV} , whichever is later. (READ CYCLE 2). The data outputs will repeatedly respond to address changes within the t_{AVQV} access time without the need for transitions on any control input pins and will remain valid until another address change or until E (bar) or G (bar) is brought HIGH or W (bar) or NE (bar) is brought LOW.

SRAM WRITE

A write cycle is performed whenever E (bar) and W (bar) are LOW and NE (bar) is HIGH. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either E (bar) or W (bar) go HIGH at the end of the cycle. The data on the eight pins DQ_{0-7} , will be written into the memory location specified by the address inputs if valid t_{DVWH} before the end of a W (bar) controlled WRITE or t_{DVEH} before the end of an E (bar) controlled WRITE.

P10C68/P11C68

It is recommended that $\overline{G}$ be kept HIGH during the entire WRITE cycle to avoid data bus contention on the common I/O lines. If $\overline{G}$ is left LOW, internal circuitry will turn off the output buffers t_{WHQZ} after $\overline{W}$ goes LOW.

Non-Volatile STORE - P10C68

A STORE cycle is performed when $\overline{NE}$ (bar), $\overline{E}$ (bar) and $\overline{W}$ (bar) are LOW and $\overline{G}$ (bar) is HIGH. While any sequence to achieve this state will initiate a STORE, only $\overline{W}$ (bar) initiation (STORE CYCLE 1) and $\overline{E}$ (bar) initiation (STORE CYCLE 2) are practical without risking an unintentional SRAM WRITE that would disturb SRAM data. During the STORE cycle, previous non-volatile data is erased and the SRAM contents are then programmed into non-volatile elements. Once a STORE cycle is initiated, further input and output is disabled and the DQ_{0-7} pins are tri-stated until the cycle is completed.

If $\overline{E}$ (bar) and $\overline{G}$ (bar) are LOW and $\overline{W}$ (bar) and $\overline{NE}$ (bar) are HIGH at the end of the cycle, a READ will be performed and the outputs will go active, signalling the end of the STORE.

The P10C68 will not be activated into either a STORE or RECALL cycle by the software sequence required for the P11C68.

Hardware Protect - P10C68

The P10C68 offers two levels of protection to suppress inadvertent STORE cycles. If the clock signals remain in the STORE condition at the end of a STORE cycle, a second STORE cycle will not be started. The STORE will be initiated only after a HIGH to LOW transition on $\overline{NE}$ (bar). Also because the STORE cycle is initiated by an $\overline{NE}$ (bar) transition, powering-up the chip with $\overline{NE}$ (bar) Low will not initiate a STORE cycle either.

In addition to multi-trigger protection, the P10C68 offers hardware protection through Vcc Sense. A STORE cycle will not be initiated, and one in progress will discontinue, if Vcc goes below 3.3V.

Non-Volatile RECALL - P10C68

A RECALL cycle is performed when $\overline{E}$ (bar), $\overline{G}$ (bar) and $\overline{NE}$ (bar) are LOW and $\overline{W}$ (bar) is HIGH. Like the STORE cycle, RECALL is initiated when the last of the four clock signals goes to the RECALL state. Once initiated, the RECALL cycle will take t_{NLOX} to complete, during which all inputs are ignored. When the RECALL completes, any READ or WRITE state on the input pins will take effect.

Internally, RECALL is a two step procedure. First the SRAM data is cleared and second, the non-volatile information is transferred into the SRAM cells. The RECALL operation in no way alters the data in the non-volatile cells. The non-volatile data can be recalled an unlimited number of times. Like the STORE cycle, a transition must occur on the $\overline{NE}$ (bar) pin to cause a RECALL, preventing inadvertent multi-triggering. On power-up, once Vcc exceeds Vcc sense voltage of 3.3V, a RECALL cycle is automatically initiated. The voltage on the Vcc pin must not drop below 3.3V once it has risen above it in order for the RECALL to operate properly. Due to the automatic RECALL, SRAM operation cannot commence until t_{NLOX} after Vcc exceeds 3.3V.

The automatic RECALL feature can be adversely affected by factors such as supply rise time, temperature and elapsed

time since the last STORE cycle. For this reason it is recommended that the user initiate a RECALL cycle after power-up for critical applications

P11C68 Non-Volatile STORE

The P11C68 STORE cycle is initiated by executing sequential READ cycles from six specific address locations. By relying on READ cycles only, the P11C68 implements non-volatile operation while remaining pin-for-pin compatible with standard 8Kx8 SRAMs. During the STORE cycle, an erase of the previous non-volatile data is first performed, followed by a program of the non-volatile elements. The program operation copies the SRAM data into non-volatile storage. Once a STORE cycle is initiated, further input and output are disabled until the cycle is completed. Because a sequence of addresses is used for STORE initiation, it is critical that no invalid address states intervene in the sequence or the sequence will be aborted. The maximum skew between address inputs A0-12 for each address state is t_{SKEW} (STORE CYCLE 1).

If t_{SKEW} is exceeded it is possible that the transitional data state will be interpreted as a valid address and the sequence will be aborted. If $\overline{E}$ (bar) controlled READ cycles are used for the sequence (STORE CYCLE 2), address skew is no longer a concern.

To enable the STORE cycle the following READ sequence must be performed.

1. Read address 0000 (hex) Valid READ
2. Read address 1555 (hex) Valid READ
3. Read address 0AAA (hex) Valid READ
4. Read address 1FFF (hex) Valid READ
5. Read address 10F0 (hex) Valid READ
6. Read address 0F0F (hex) Initiate STORE Cycle

Once the sixth address in the sequence has been entered, the STORE cycle will commence and the chip will be disabled. It is important that READ cycles and not WRITE cycles be used in the sequence, although it is not necessary that $\overline{G}$ (bar) be LOW for the sequence to be valid. After the t_{STORE} cycle time has been fulfilled, the SRAM will again be activated for READ and WRITE operation.

Once the first of the six reads has taken place, the read sequence must either complete or terminate with an incorrect address (other than 0000 hex) before it may be started anew.

P11C68 Hardware Protect

The P11C68 offers hardware protection against inadvertent STORE cycles through Vcc Sense. A STORE cycle will not be initiated, and one in progress will discontinue, if Vcc goes below 3.3V.

P11C68 Non-Volatile RECALL

A RECALL of the EEPROM data into the SRAM is initiated with a sequence of READ operations in a manner similar to the STORE initiation. To initiate the RECALL cycle the following sequence of READ operations must be performed:

1. Read address 0000 (hex) Valid READ
2. Read address 1555 (hex) Valid READ
3. Read address 0AAA (hex) Valid READ
4. Read address 1FFF (hex) Valid READ
5. Read address 10F0 (hex) Valid READ
6. Read address 0F0E (hex) Initiate RECALL Cycle

Internally, RECALL is a two step procedure. First, the SRAM data is cleared and second the non-volatile information is transferred into the SRAM cells. The RECALL operation in no way alters the data in the EEPROM cells. The non-volatile data can be recalled an unlimited number of times.

On power-up, once V_{CC} exceeds the V_{CC} sense voltage of 3.3V, a RECALL cycle is automatically initiated. The voltage on the V_{CC} pin must not drop below 3.3V once it has risen above it in order for the RECALL to operate properly. Due to this automatic RECALL, SRAM operation cannot commence until t_{RECALL} after V_{CC} exceeds 3.3V.

The automatic RECALL feature can be adversely affected by factors such as supply rise time, temperature and elapsed time since the last STORE cycle. For this reason it is recommended that the user initiate a RECALL cycle after power-up for critical applications.

PACKAGE DETAILS

Dimensions are shown thus: mm (in). For further package information please contact your local Customer Service Centre.

Figure 16, 28-lead sidebraced ceramic DIL (0.3in) DCB

Figure 17, 28 plastic DIL Package (0.3in) DPB

ORDERING INFORMATION

PxxC68 - xx / xG / DxBS

Package type

C = Ceramic
P = Plastic

Temperature range

C = Commercial
I = Industrial

Speed Grade

-35 = 35ns
-45 = 45ns

Device number

eg. 10 = hardware store/recall
11 = software store/recall

HEADQUARTERS OPERATIONS
