DISTRIBUTION STATEMENT A. Approved for public release; distribution is unlimited.

1. SCOPE

- 1.1 <u>Scope</u>. This drawing forms a part of a one part one part number documentation system (see 6.6 herein). Two product assurance classes consisting of military high reliability (device classes B, Q, and M) and space application (device classes S and V), and a choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). Device class M microcircuits represent non-JAN class B microcircuits in accordance with 1.2.1 of MIL-STD-883, "Provisions for the use of MIL-STD-883 in conjunction with compliant non-JAN devices". When available, a choice of radiation hardness assurance (RHA) levels are reflected in the PIN.
 - 1.2 PIN. The PIN shall be as shown in the following example:

- 1.2.1 <u>Radiation hardness assurance (RHA) designator</u>. Device classes M, B, and S RHA marked devices shall meet the MIL-M-38510 specified RHA levels and shall be marked with the appropriate RHA designator. Device classes Q and V RHA marked devices shall meet the MIL-I-38535 specified RHA levels and shall be marked with the appropriate RHA designator. A dash (-) indicates a non-RHA device.
 - 1.2.2 <u>Device type(s)</u>. The device type(s) shall identify the circuit function as follows:

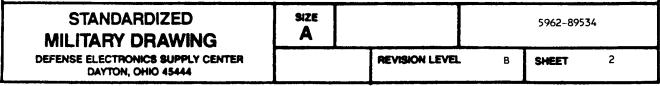

Device type	Generic number	<u>Circuit function</u>
01	80387-16	Numeric processor extension, 80-bit
02	80387-20	Numeric processor extension, 80-bit
03	80387-25	Numeric processor extension, 80-bit

1.2.3 <u>Device class designator</u>. The device class designator shall be a single letter identifying the product assurance level as follows:

Device class	Device requirements documentation								
M	Vendor self-certification to the requirements for non-JAN class B microcircuits in accordance with 1.2.1 of MIL-STD-883								
B or S	Certification and qualification to MIL-M-38510								
Q or V	Certification and qualification to MIL-I-38535								

1.2.4 <u>Case outline(s)</u>. For device classes M, B, and S, case outline(s) shall meet the requirements in appendix C of MIL-M-38510 and as listed below. For device classes Q and V, case outline(s) shall meet the requirements of MIL-I-38535, appendix C of MIL-M-38510, and as listed below.

Outline letter	Case outline
X	P-AC (68-pin, 1.180" x 1.180" x .345"), pin grid array package See figure 1 (68-terminal, .970" x .970" x .115"), ceramic quad flat
,	package

DESC FORM 193A SEP 87

+ U & GOVERNMENT PRINTING OFFICE 1985-\$50-547

1.2.5 <u>Lead finish</u>. The lead finish shall be as specified in MIL-M-38510 for classes M, B, and S or MIL-I-38535 for classes Q and V. Finish letter "X" shall not be marked on the microcircuit or its packaging. The "X" designation is for use in specifications when lead finishes A, B, and C are considered acceptable and interchangeable without preference. 1.3 Absolute maximum ratings. Voltage on any pin (referenced to GND) ------0.5 V dc to V_{CC} +0.5 V -65°C to +150°C Storage temperature range - - - - - - - - - - - - - - - - - -Maximum power dissipation (PD) -----2.1 W Thermal resistance, junction-to-case (O_{JC}): See MIL-M-38510, appendix C Junction temperature (T₁) - - - - - - - - - - - - - - -Lead temperature (soldering, 10 seconds) -----+260°C 1.4 Recommended operating conditions. HANDBOOK

MILITARY

MIL-HDBK-780

Standardized Military Drawings.

(Copies of the specifications, standards, bulletin, and handbook required by manufacturers in connection with specific acquisition functions should be obtained from the contracting activity or as directed by the contracting activity.)

2.2 Order of precedence. In the event of a conflict between the text of this drawing and the references cited herein, the text of this drawing shall take precedence.

3. REQUIREMENTS

- 3.1 <u>Item requirements</u>. The individual item requirements for device class M shall be in accordance with 1.2.1 of MIL-STD-883, "Provisions for the use of MIL-STD-883 in conjunction with compliant non-JAN devices" and as specified herein. The individual item requirements for device classes B and S shall be in accordance with MIL-M-38510 and as specified herein. For device classes B and S, a full electrical characterization table for each device type shall be included in this SMD. The individual item requirements for device classes Q and V shall be in accordance with MIL-I-38535, the device manufacturer's Quality Management (QM) plan, and as specified herein.
- 3.2 <u>Design, construction, and physical dimensions</u>. The design, construction, and physical dimensions shall be as specified in MIL-M-38510 for device classes M, B, and S and MIL-I-38535 for device classes Q and V and herein.
 - 3.2.1 Case outline(s). The case outline(s) shall be in accordance with 1.2.4 herein and figure 1.
 - 3.2.2 <u>Terminal connections</u>. The terminal connections shall be as specified on figure 2.
 - 3.2.3 Functional block diagrams. The functional block diagram shall be as specified on figure 3.
- 3.3 <u>Electrical performance characteristics and postirradiation parameter limits</u>. Unless otherwise specified herein, the electrical performance characteristics and postirradiation parameter limits are as specified in table I and shall apply over the full case operating temperature range.
- 3.4 <u>Electrical test requirements</u>. The electrical test requirements shall be the subgroups specified in table IIA. The electrical tests for each subgroup are defined in table I.
- 3.5 Marking. The part shall be marked with the PIN listed in 1.2 herein. Marking for device class M shall be in accordance with MIL-STD-883 (see 3.1 herein). In addition, the manufacturer's PIN may also be marked as listed in MIL-BUL-103. Marking for device classes B and S shall be in accordance with MIL-M-38510. Marking for device classes Q and V shall be in accordance with MIL-I-38535.
- 3.5.1 <u>Certification/compliance mark.</u> The compliance mark for device class M shall be a "C" as required in MIL-STD-883 (see 3.1 herein). The certification mark for device classes B and S shall be a "J" or "JAN" as required in MIL-M-38510. The certification mark for device classes Q and V shall be a "QML" as required in MIL-I-38535.
- 3.6 <u>Certificate of compliance</u>. For device class M, a certificate of compliance shall be required from a manufacturer in order to be listed as an approved source of supply in MIL-BUL-103 (see 6.7.3 herein). For device classes Q and V, a certificate of compliance shall be required from a QML-38535 listed manufacturer in order to supply to the requirements of this drawing (see 6.7.2 herein). The certificate of compliance submitted to DESC-ECC prior to listing as an approved source of supply for this drawing shall affirm that the manufacturer's product meets, for device class M the requirements of MIL-STD-883 (see 3.1 herein), or for device classes Q and V, the requirements of MIL-I-38535 and the requirements herein.

operand write)

1/ Guaranteed, if not tested, to the limits specified.

2/ I_{CC} is measured at steady state, maximum capacitance loading on the outputs, and worst case dc level at the inputs, 386CLK2 at the same frequency as 387CLK2.

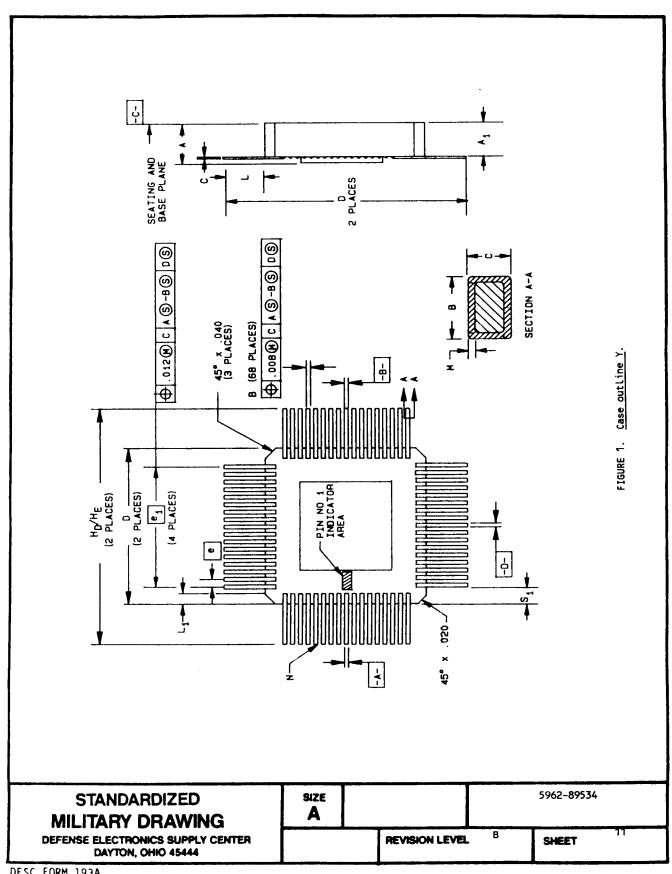

3/ See figure 4.

 $\frac{27}{4}$ / Capacitive load for 25 MHz equals 50 pf. $\frac{5}{2}$ / Float condition occurs when maximum output current becomes less than I_{LO} in magnitude.

NOTES:

- 1 Dimensions are in inches.
- Metric equivalents are for general information only.
- 3. Unless otherwise specified, tolerance for three place decimals is $\pm .005$.
- 4. The index feature for terminal 1 identification, optical orientation, or handling purposes shall be within the shaded index areas shown on planes 1 and 2. Terminal 1 identification is optional on the surface closest to the seating plane.
- Corner shapes (square notch, radius, etc.) may vary from that shown on the drawing.
 The index corner shall be clearly unique.
- 6 Dimension N: Number of terminals per package edge.
- 7. Dimensioning is in accordance with ANSI Y14.5M 1982.
- 8. Lead coplanarity shall be within .004 inch (0.10 mm) and measured at 0.05 inch from package body.
- 9. No overhang of the lead on the braze pad is allowed.
- 10. Dimensions B and C apply to base metal only. Dimension M applies to plating thickness.
- 11. The leads on this package style shall be protected from mechanical distortion and damage such that dimensions pertaining to relative lead/body "true positions" and lead "coplanarity" are always maintained until the next higher level package attachment process is complete. Package lead protection mechanisms (tie bars, carriers, etc.) are now shown on the drawing; however, when microcircuit devices contained in this package style are shipped for use in Government equipment, or shipped directly to the Government as spare parts or mechanical qualification samples, lead "true position" and "coplanarity" protection shall be in place.

- 3.7 (entificate of conformance. A centificate of conformance as required for device class M in MIL SID 883 (see 3.1 herein) or device classes B and S in MIL-M-38510 or for device classes Q and V in MIL-I-38535 shall be provided with each lot of microcircuits delivered to this drawing.
- 3.8 <u>Notification of change for device class M</u>. For device class M, notification to DESC-ECC of change of product (see 6.2 herein) involving devices acquired to this drawing is required for any change as defined in MIL-STD-480.
- 3.9 <u>Verification and review for device class M</u>. For device class M, DESC, DESC's agent, and the acquiring activity retain the option to review the manufacturer's facility and applicable required documentation. Offshore documentation shall be made available onshore at the option of the reviewer.
- 3.10 <u>Microcircuit group assignment for device classes M, B, and S</u>. Device classes M, B, and S devices covered by this drawing shall be in microcircuit group number 105 (see MIL-M-38510, appendix E).
- 3.11 <u>Serialization for device class S</u>. All device class S devices shall be serialized in accordance with MIL-M-38510.
- 3.12 <u>PIN supersession information</u>. The PIN supersession information shall be as specified in the appendix.
 - 4. QUALITY ASSURANCE PROVISIONS
- 4.1 <u>Sampling and inspection</u>. For device class M, sampling and inspection procedures shall be in accordance with section 4 of MIL-M-38510 to the extent specified in MIL-STD-883 (see 3.1 herein). For device classes B and S, sampling and inspection procedures shall be in accordance with MIL-M-38510 and method 5005 of MIL-STD-883, except as modified herein. For device classes Q and V, sampling and inspection procedures shall be in accordance with MIL-I-38535 and the device manufacturer's QM plan.
- 4.2 <u>Screening</u>. For device class M, screening shall be in accordance with method 5004 of MIL-STD-883, and shall be conducted on all devices prior to quality conformance inspection. For device classes B and S, screening shall be in accordance with method 5004 of MIL-STD-883, and shall be conducted on all devices prior to qualification and quality conformance inspection. For device classes Q and V, screening shall be in accordance with MIL-I-38535, and shall be conducted on all devices prior to qualification and technology conformance inspection.
 - 4.2.1 Additional criteria for device classes M, B, and S.
 - a. Burn-in test, method 1015 of MIL-STD-883.
 - (1) Test condition C or D. For device class M, the test circuit shall be submitted to DESC-ECC for review with the certificate of compliance. For device classes B and S, the test circuit shall be submitted to the qualifying activity.
 - (2) $T_{\Delta} = +125^{\circ}C$, minimum.
 - b. Interim and final electrical test parameters shall be as specified in table IIA herein.

4.2.2 Additional criteria for device classes Q and V.

- a. The burn-in test duration, test condition and test temperature or approved alternatives shall be as specified in the device manufacturer's QM plan in accordance with MIL-I-38535. The burn-in test circuit shall be submitted to DESC-ECC with the certificate of compliance and shall be under the control of the device manufacturer's Technology Review Board (TRB) in accordance with MIL-I-38535.
- b. Interim and final electrical test parameters shall be as specified in table IIA herein.
- c. Additional screening for device class V beyond the requirements of device class Q shall be as specified in appendix B of MIL-I-38535 and as detailed in table IIB herein.

4.3 Qualification inspection.

4.3.1 <u>Qualification inspection for device classes B and S</u>. Qualification inspection for device classes B and S shall be in accordance with MIL-M-38510. Inspections to be performed shall be those specified in method 5005 of MIL-STD-883 and herein for groups A, B, C, D, and E inspections (see 4.4.1 through 4.4.5).

- 4.3.2 <u>Qualification inspection for device classes Q and V</u>. Qualification inspection for device classes Q and V shall be in accordance with MIL-I-38535. Inspections to be performed shall be those specified in MIL-I-38535 and herein for groups A, B, C, D, and E inspections (see 4.4.1 through 4.4.5).
- 4.4 <u>Conformance inspection</u>. Quality conformance inspection for device class M shall be in accordance with MIL-STD-883 (see 3.1 herein) and as specified herein. Quality conformance inspection for device classes B and S shall be in accordance with MIL-M-38510 and as specified herein. Inspections to be performed for device classes M, B, and S shall be those specified in method 5005 of MIL-STD-883 and herein for groups A, B, C, D, and E inspections (see 4.4.1 through 4.4.5). Technology conformance inspection for classes Q and V shall be in accordance with MIL-1-38535 including groups A, B, C, D, and E inspections and as specified herein except where option 2 of MIL-I-38535 permits alternate in-line control testing.
 - 4.4.1 Group A inspection.
 - a. Tests shall be as specified in table IIA herein.
 - b. Subgroups 5 and 6 in table I, method 5005 of MIL-STD-883 shall be omitted.
 - c. Subgroup 4 (C_{IO} measurement) shall be measured only for the initial test and after process and design changes which may affect capacitance. A minimum sample size of 5 devices with zero rejects shall be required.
 - d. For device class M, subgroups 7 and 8 tests shall include verification of the device functionality. These tests shall be maintained and available from the approved source of supply upon request. For device classes B and S, subgroups 7 and 8 tests shall include verification of the device functionality. For device classes Q and V, subgroups 7 and 8 shall include verifying the functionality of the device; these tests shall have been graded in accordance with MIL-STD-883, test method 5012 (see 1.5 herein).
- 4.4.2 <u>Group B inspection</u>. The group B inspection end-point electrical parameters shall be as specified in table IIA herein.
- 4.4.3 <u>Group C inspection</u>. The group C inspection end-point electrical parameters shall be as specified in table IIA herein.

- 4.4.3.1 Additional criteria for device classes M, B, and S. Steady state life test conditions, method 1005 of MIL-SID-883:
 - a. Test condition C or D. For device class M, the test circuit shall be submitted to DESC-ECC for review with the certificate of compliance. For device classes B and S, the test circuit shall be submitted to the qualifying activity.
 - b. $T_A = +125^{\circ}C$, minimum.
 - c. Test duration: 1,000 hours, except as permitted by method 1005 of MIL-STD-883.
- 4.4.3.2 Additional criteria for device classes Q and V. The steady-state life test duration, test condition and test temperature or approved alternatives shall be as specified in the device manufacturer's QM plan in accordance with MIL-I-38535. The steady-state life test circuit shall be submitted to DESC-ECC with the certificate of compliance and shall be under the control of the device manufacturer's TRB in accordance with MIL-I-38535.
- 4.4.4 Group D inspection. The group D inspection end-point electrical parameters shall be as specified in table IIA herein.
- 4.4.5 <u>Group E inspection</u>. Group E inspection is required only for parts intended to be marked as radiation hardness assured (see 3.5 herein). RHA levels for device classes B, S, Q, and V shall be M, D, R, and H and for device class M shall be M and D. RHA quality conformance inspection sample tests shall be performed at the RHA level specified in the acquisition document.
 - a. RHA tests for device classes B and S for levels M, D, R, and H or for device class M for levels M and D shall be performed through each level to determine at what levels the devices meet the RHA requirements. These RHA tests shall be performed for initial qualification and after design or process changes which may affect the RHA performance of the device.
 - b. End-point electrical parameters shall be as specified in table IIA herein.
 - c. Prior to total dose irradiation, each selected sample shall be assembled in its qualified package. It shall pass the specified group A electrical parameters in table I for subgroups specified in table IIA herein.
 - d. For device classes M, B, and S, the devices shall be subjected to radiation hardness assured tests as specified in MIL-M-38510 for RHA level being tested, and meet the postirradiation end-point electrical parameter limits as defined in table I at $T_A = +25$ °C ± 5 percent, after exposure.
 - e. Prior to and during total dose irradiation testing, the devices shall be biased to establish a worst case condition as specified in the radiation exposure circuit.
 - f. For device classes M, B, and S, subgroups 1 and 2 in table V, method 5005 of MIL-STD-883 shall be tested as appropriate for device construction.
 - g. When specified in the purchase order or contract, a copy of the RHA delta limits shall be supplied.

5. PACKAGING

5.1 <u>Packaging requirements</u>. The requirements for packaging shall be in accordance with MIL-M-38510 for device classes M, B, and S and MIL-I-38535 for device classes Q and V.

6. NOTES

- 6.1 <u>Intended use</u>. Microcircuits conforming to this drawing are intended for use for Government microcircuit applications (original equipment), design applications, and logistics purposes.
- 6.1.1 <u>Replaceability</u>. Microcircuits covered by this drawing will replace the same generic device covered by a contractor-prepared specification or drawing.
 - 6.1.2 <u>Substitutability</u>. Device classes B and Q devices will replace device class M devices.
- 6.2 <u>Configuration control of SMD's</u>. All proposed changes to existing SMD's will be coordinated with the users of record for the individual documents. This coordination will be accomplished in accordance with MIL-STD-481 using DD Form 1693, Engineering Change Proposal (Short Form).
- 6.3 <u>Record of users</u>. Military and industrial users shall inform Defense Electronics Supply Center when a system application requires configuration control and which SMD's are applicable to that system. DESC will maintain a record of users and this list will be used for coordination and distribution of changes to the drawings. Users of drawings covering microelectronic devices (FSC 5962) should contact DESC-ECC, telephone (513) 296-6022.
- 6.4 <u>Comments</u>. Comments on this drawing should be directed to DESC-ECC, Dayton, Ohio 45444, or telephone (513) 296-8525.
 - 6.5 Pin descriptions.

386CLK2

This input uses the 80386 CLK2 signal to time the bus control logic. Several other 80387 signals are referenced to the rising edge of this signal. When CKM = 1 (synchronous mode) this pin also clocks the data interface and control unit and the floating point unit of the 80387. This pin requires MOS level input. The signal on this pin is divided by two to produce the internal clock signal CLK.

387CLK2

When CKM = 0 (asynchronous mode) this pin provides the clock for the data interface and control unit and the floating point unit of the 80387. In this case, the ratio of the frequency of the 387CLK2 to the 386CLK2 must lie within the range 10:16 to 14:10. When CKM = 1 (synchronous mode) this pin is ignored; 386CLK2 is used instead for the data interface and control unit and the floating-point unit. This pin requires TTL-level input.

CKM

This pin is a strapping option. When it is strapped to $V_{\rm CC}$, the 80387 operates in the asynchronous mode. These modes relate to clocking of the data interface and control unit and the floating point unit only; the bus control logic always operates synchronously with respect to the 80386.

RESETIN

A low to high transition on this pin causes the 80387 to terminate its present activity and to enter a dormant state. RESETIN must remain high for at least 40 387CLK2 periods. The high to low transitions of the RESETIN must be synchronous with 386CLK2, so that the phase of the internal clock of the bus control logic (which is the 386CLK2 divided by 2) is the same phase of the internal clock of the 80386. After RESETIN goes low, at least 50 387CLK2 periods must pass before the first NPX instruction is written to the 80387. This pin should be connected to the 80386 RESET pin. Status of other pins after a reset shall be indicated as follows:

STANDARDIZED
MILITARY DRAWING
DEFENSE ELECTRONICS SUPPLY CENTER
DAYTON, OHIO 45444

SIZE 5962-89534

REVISION LEVEL B SHEET

DESC FORM 193A SEP 87

e U.S. GOVERNMENT PRINTING OFFICE 1988—550-547

Pin name	 Pin value
READYO, BUSY	 high
PEREQ, ERROR	low
D31-D0	3-state

PEREQ

When active, the pin signals to the 80386 CPU that the 80387 is ready for data transfer to/from its data FIFO. When all data is written to or read from the data FIFO, PEREQ is deactivated. This signal always goes inactive before BUSY goes inactive. This signal is referenced to the 386CLK2. It should be connected to the 80386 PEREQ input. Refer to figure 3 for timing relationships between this and the BUSY and the ERROR pins.

BUSY

When active, the pin signal to the 80386 CPU that the 80387 is currently executing an instruction. This signal is referenced to the 386CLK2. It should be connected to the 80386 BUSY pin. Refer to figure 3 for timing relationships between this and the PEREQ and the ERROR pins.

ERROR

This pin reflects the ES bits of the status register. When active, it indicates that an unmasked exception has occurred (except that, immediately after a reset, it indicates to the 80386 that an 80387 is present in the system). This signal can be changed to inactive state only by the following instructions (without a preceding WAIT): FNINIT, FNCLEX, FNSTENV, and FNSAVE. This signal is referenced to 387CLK2. It should be connected to the 80386 ERROR pin. Refer to figure 3 for the timing relationships between this and the PEREQ and BUSY pins.

D31-D0

These bidirectional pins are used to transfer data and opcodes between the 80386 and 80387. They are normally connected directly to the corresponding 80386 data pins. High state indicates a value on one. DO is the least significant data bit. Timings are referenced to 386CLK2.

W/R

This signal indicates to the 80387 whether the 80386 bus cycle in progress is a read or a write cycle. This pin should be connected directly to the 80386 W/R pin. High indicates a write cycle; \underline{low} , a read cycle. This input is ignored if any of the signals STEN, NPS1, or NPS2 is inactive. Setup and hold times are referenced to 386CLK2.

ADS

This input, in conjunction with the $\overline{\text{READY}}$ input indicates when the 80387 bus control logic may sample W/R and the chip select signals. Setup and hold times are referenced to 386CLK2. This pin should be connected to the 80386 ADS pin.

READY

This input indicates to the 80387 when an 80386 bus cycle is to be terminated. It is used by the bus control logic to trace bus activities. Bus cycles can be extended indefinitely until terminated by READY. This input should be connected to the same signal that drives the 80386 READY input. Setup and hold times are referenced to 386CLK2.

STANDARDIZED
MILITARY DRAWING
DEFENSE ELECTRONICS SUPPLY CENTER
DAYTON, OHIO 45444

SIZE 5962-89534

REVISION LEVEL B SHEET

DESC FORM 193A SEP 87

U & GOVERNMENT PRINTING OFFICE 1866-550-547

This pin is activated at such a time that write cycles are terminated READYO after two clocks and read cycles after three clocks. In configurations where no extra wait states are required, it can be used to directly drive the 80386 READY input. This pin is activated only during bus cycles that select the 80387. This signal is referenced to 386CLK2. This pin serves as a chip select for the 80387. When inactive, this pin STEN forces BUSY, PEREQ, ERROR, and READYO outputs into floating state. D31-DO are normally floating and leave floating state only if STEN is active and additional conditions are met. STEN also causes the chip to recognize its other chip select inputs. STEN makes it easier to do on board testing (using the overdrive method) of other chips in systems containing the 80387. STEN should be pulled up with a resistor so that it can be pulled down when testing. In boards that do not use on board testing, STEN should be connected to V_{CC} . Setup and hold times as NPS1, NPS2, and CMDO (i.e., if STEN changes state during an $8\underline{0387}$ bus cycle, it should change state during the same CLK period as the NPS1, NPS2, and CMDO signals). When active (along with STEN and NPS2 in the first period of an 80386 bus NPS1 cycle), this signal indicates that the purpose of the bus cycle is to communicate with the 80387. This pin should be connected directly to the $80386\ \text{M/}10\ \text{pin}$, so that the $80387\ \text{is}$ selected only when the $80386\ \text{performs}$

When active (along with STEN and NPS1 in the first period of an 80386 bus cycle), this signal indicates that the purpose of the bus cycle is to communicate with the 80387. This pin should be connected directly to the 80386 A31 pin, so that the 80387 is selected only when the 80386 uses one of the I/O addresses reserved for the 80387 (8000000F8 or 800000FC). Setup

I/O cycles. Setup and hold times are referenced to 386CLK2.

and hold times are referenced to 386CLK2.

During a write cycle, this signal indicates whether an opcode (CMDO active) or data (CMDO inactive) is being sent to the 80387. During a read cycle, it indicates whether the control or the status register (CMDO active) or the data register (CMDO inactive) is being read. CMDO should be connected directly to the A2 output of the 80386. Setup and hold times are referenced to 386CLK2.

6.6 One part - one part number system. The one part - one part number system described below has been developed to allow for transitions between identical generic devices covered by the four major microcircuit requirements documents (MIL-M-38510, MIL-H-38534, MIL-I-38535, and 1.2.1 of MIL-STD-883) without the necessity for the generation of unique PIN's. The four military requirements documents represent different class levels, and previously when a device manufacturer upgraded military product from one class level to another, the benefits of the upgraded product were unavailable to the Original Equipment Manufacturer (OEM), that was contractually locked into the original unique PIN. By establishing a one part number system covering all four documents, the OEM can acquire to the highest class level available for a given generic device to meet system needs without modifying the original contract parts selection criteria.

Military documentation format	Example PIN under new system	Manufacturing source listing	Document <u>Listing</u>
New MIL-M-38510 Military Detail Specifications (in the SMD format)	5962-XXXXXZZ(B or \$)YY	QPL-38510 (Part 1 or 2)	MIL-BUL-103
