1. Transition is measured ± 200 mV from steady state's voltage with Load (B). This parameter is sampled and not 100% tested.
 2. When $\overline{CS}$, $\overline{OE}$, and $\overline{LB}$ are low, $Dout$ (lower byte) is low impedance. When $\overline{CS}$, $\overline{OE}$, and $\overline{UB}$ are low, $Dout$ (upper byte) is low impedance.
 3. $\overline{WE}$ is high for read cycle.

Write Timing Waveform (3) ($\overline{LB}$, $\overline{UB}$ Controlled)

- Notes:
1. Transition is measured ± 200 mV from high impedance state's voltage with Load (B). This parameter is sampled and not 100% tested.
 2. $\overline{WE}$ must be high during address transition except when the device is disabled with $\overline{CS}$, $\overline{LB}$, or $\overline{UB}$.
 3. If $\overline{CS}$, $\overline{OE}$, $\overline{LB}$, and $\overline{UB}$ are low during this period, I/O pins are in the output state. Then, the data input signals of opposite phase to the outputs must not be applied to them.
 4. If the $\overline{CS}$ or $\overline{LB}$ or $\overline{UB}$ low transition occurs simultaneously with the $\overline{WE}$ low transition or after the $\overline{WE}$ transition, output remains a high impedance state.
