ADVANCE INFORMATION

74ALCX16374
Low-Voltage 16-Bit D Flip-Flop with 5V Tolerant Inputs and Outputs

General Description

The ALCX16374 contains sixteen non-inverting D flip-flops with TRI-STATE® outputs and is intended for bus oriented applications. The device is byte controlled. A buffered clock (CP) and Output Enable (CE) are common to each byte and can be shorted together for full 16-bit operation.

The ALCX family of devices excel in bus interface applications where very high speeds and low power consumption are required. ALCX devices are capable of interfacing to the latest high-speed busses while consuming less than 20 μA of quiescent current. In keeping with National's *CROSSVOLT*™ philosophy, ALCX inputs and outputs are 5V tolerant allowing them to interface to both 3V and 5V components. ALCX inputs and outputs also power up/down in the high impedance state, facilitating power management and live insertion system features. Bus hold on all input, I/O, and control pins removes the need for power-hungry pull-up resistors on TRI-STATE busses. ±24 mA output drive means ALCX devices can drive all but the heaviest bus and backplane loads quietly due to National's patented Quiet Series™ circuitry.

Functional Description

The ALCX16374 consists of sixteen edge-triggered flip-flops with individual D-type inputs and TRI-STATE true outputs. The device is byte controlled with each byte functioning identically, but independent of the other. The control pins can be shorted together to obtain full 16-bit operation. Each byte has a buffered clock and buffered Output Enable common to all flip-flops within that byte. The description which follows applies to each byte. Each flip-flop will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP_n) transition. With the Output Enable ($\overline{OE}_n$) LOW, the contents of the flip-flops are available at the outputs. When $\overline{OE}_n$ is HIGH, the outputs go to the high impedance state. Operation of the OE_n input does not affect the state of the flip-flops.
